

The Phonological System of a Southern
Italian Dialect (Grottaminarda)

Terry Brian Cox

A thesis submitted in partial fulfillment of
the requirements for the degree of Master of Arts
of the Australian National University.

Except where otherwise acknowledged in the text
this thesis represents the original research of
the author.

ACKNOWLEDGEMENTS

I would like to express my sincere thanks to my principal informant, Mrs Maria Salza, for her time so generously given; to Pina Clericuzio, for valuable Grottaminarda material; to Mrs Rosa Maria Rossi, for information on Napoletano; to my supervisor, Dr Karl Rensch, for his guidance during the preparation of this thesis; to Miss Pauline Foot for typing such an excellent copy.

Bibliography 66

1.1 Purpose

The purpose of this thesis is to examine and describe the

Appendix 69

phonology of the dialect of Grottole. Special attention will be given to the interplay between the mid-order of the vocalic system and the nominal morphology.

The investigation will be conducted on both diachronic and synchronic axes, and an attempt will be made to present the phonemic inventory in generative terms.

1.2 The Dialect

The dialect of the village of Grottole is known locally as 'Rutés' (<grottolese-(lingua)-cryptense>). Situated in South-Central Italy, in the Province of Avellino in Campania, the village is on the main highway route from Naples to Bari (in Puglia) - a route which is now part of the national 'autostrada' network - and is 36 kilometres East of Avellino. A settlement of over seven thousand people (1971 census figures), it is nestled on the slopes of the Ufita river valley at an altitude of approximately 400 metres above sea level on the Western side of the Apennines. The area is lightly populated and being of rather rugged terrain, presents few expanses of arable land. Prior to completion of the 'autostrada' some 10 years ago, the villagers seemed primarily to have been occupied in little better than

1. Reference will also be made from time to time to data recorded in the AIS (see bibliography) from the two closest villages to Grottole, p. 723, Montafusco, 13 km. west and p. 725, Trevico, 22 km. east. (See Maps 1 and 2). Data will also be presented from Napolitano, most of which was obtained from Mrs. Rosa Maria Rossi.

CHAPTER ONE

INTRODUCTION1.1 Purpose

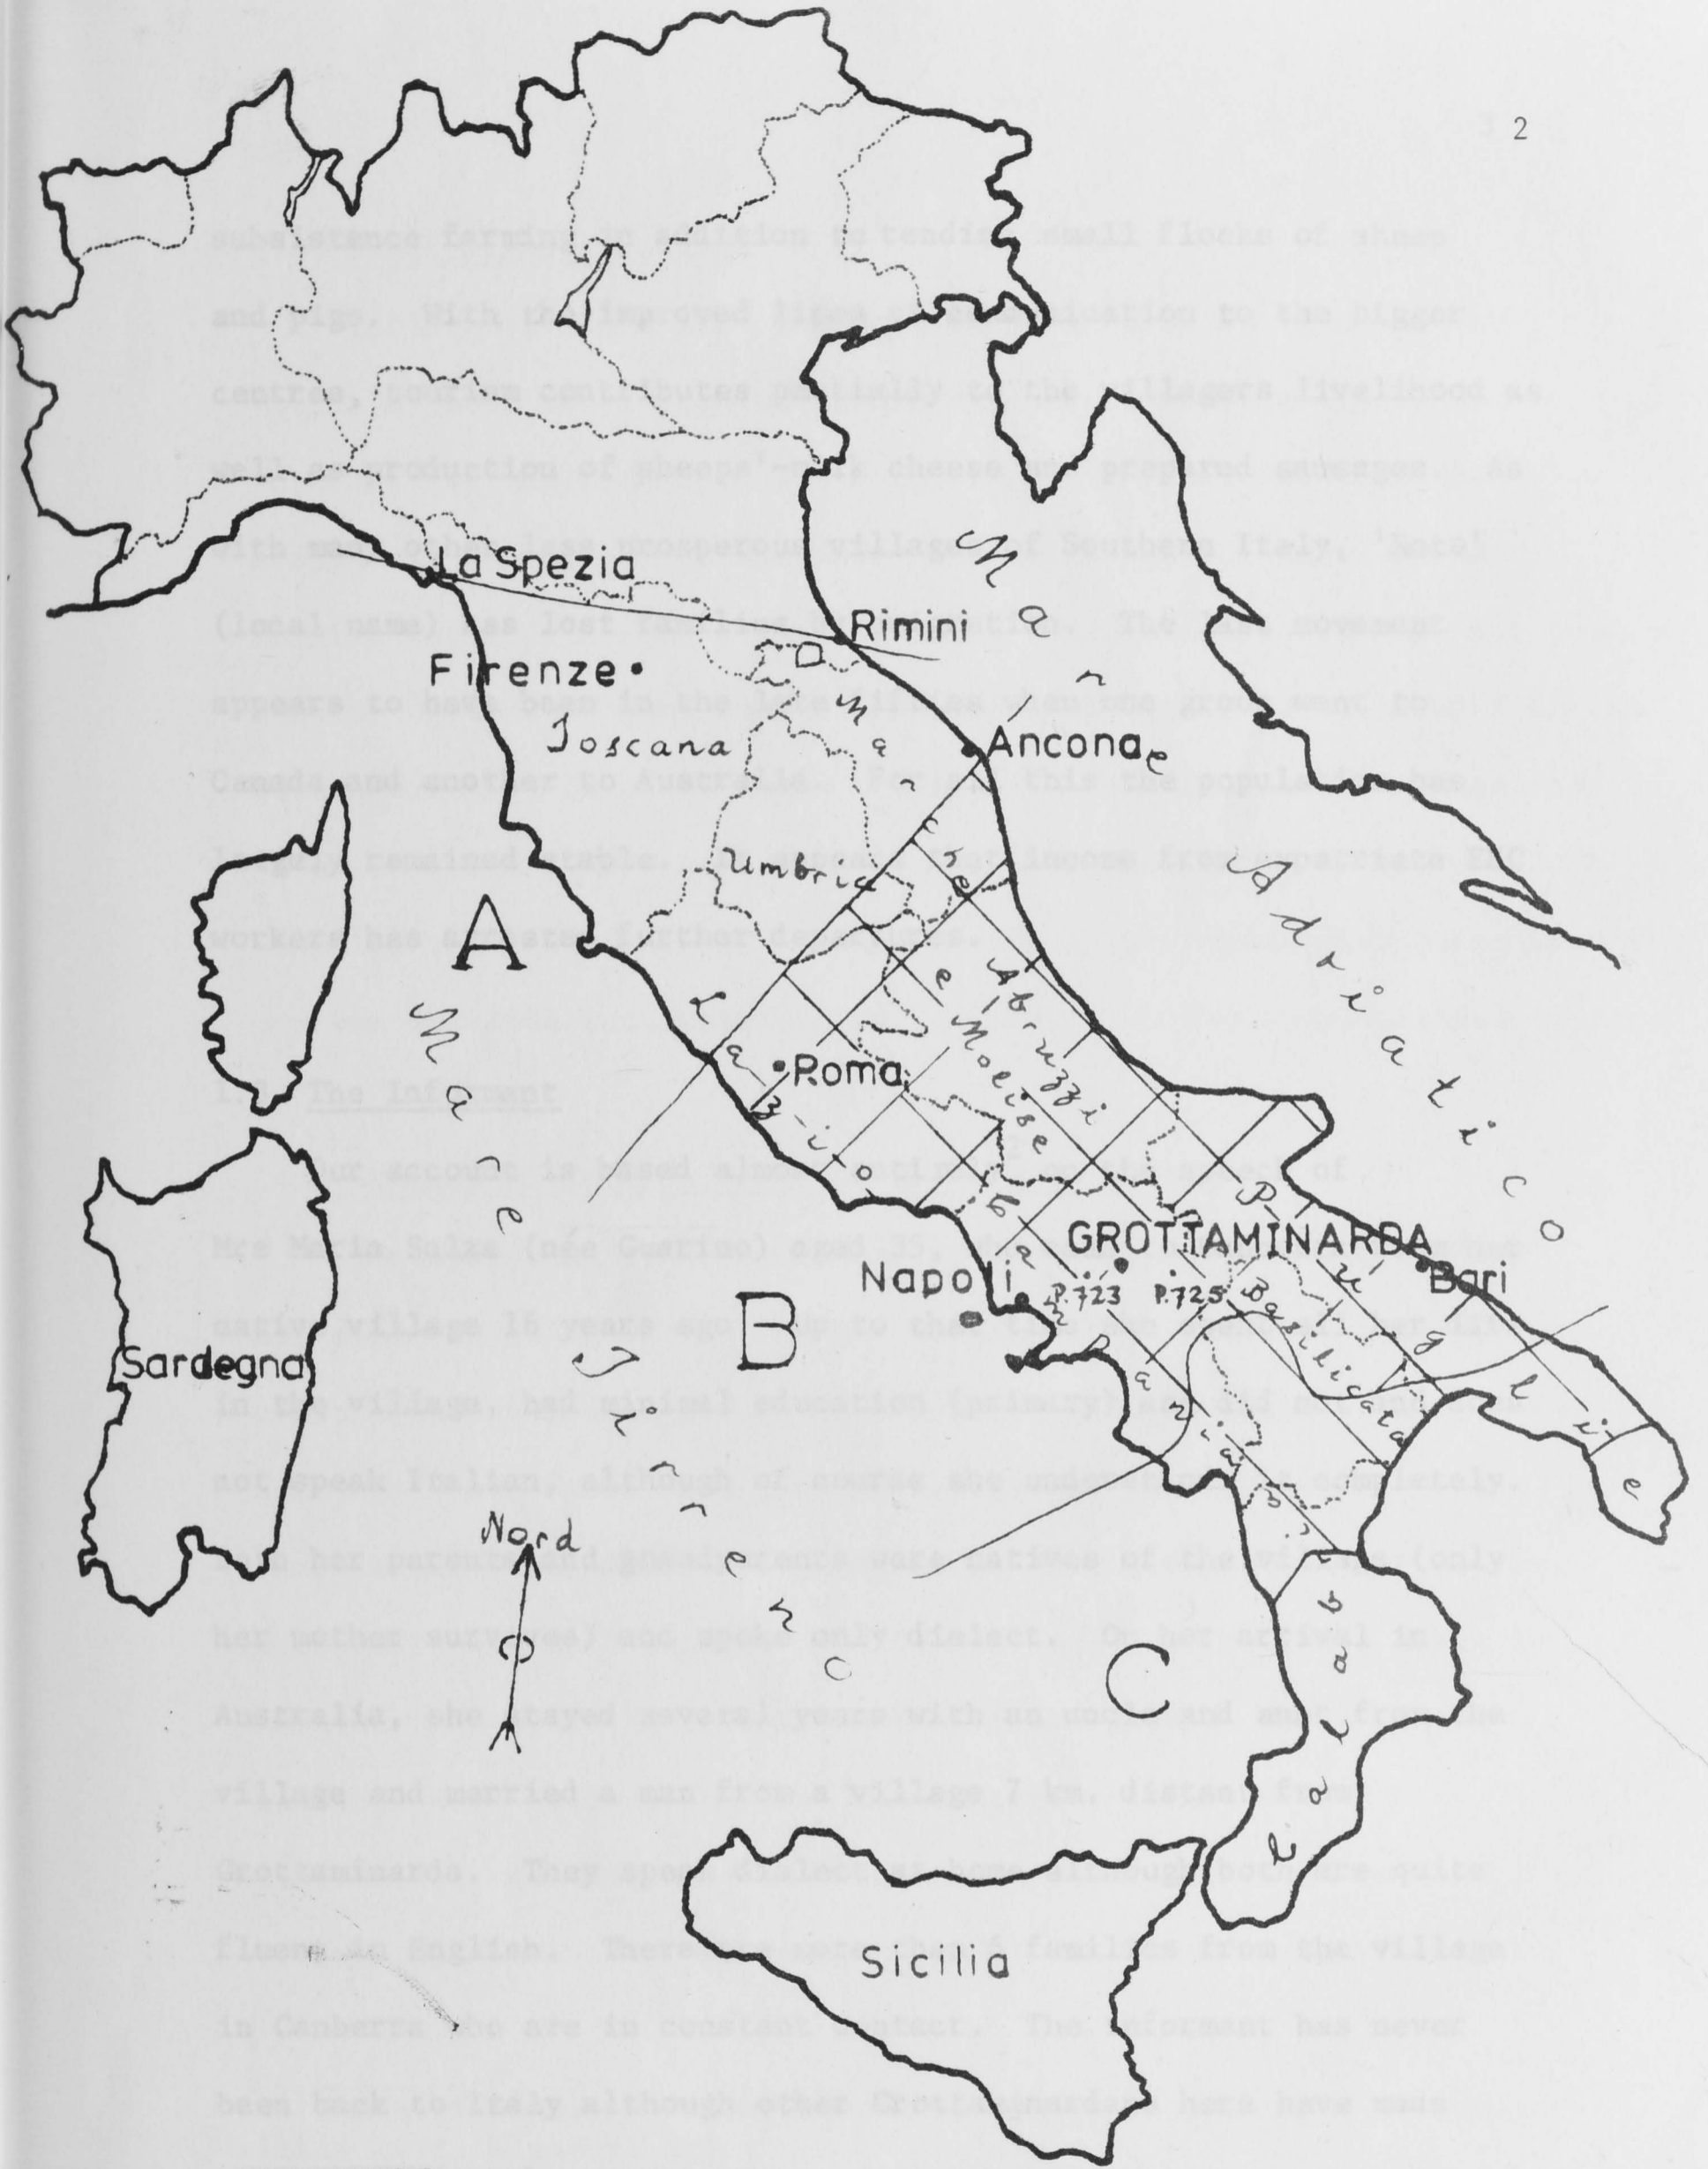

The purpose of this thesis is to examine and describe the phonology of the dialect of Grottaminarda¹. Special attention will be given to the interplay between the mid-orders of the vocalic system and the nominal morphology.

The investigation will be conducted on both diachronic and synchronic axes, and an attempt will be made to present the phonemic inventory in generative terms.

1.2 The Dialect

The dialect of the village of Grottaminarda is known locally as 'Rutés' (<grotténse<(língua)crypténse). Situated in South-Central Italy, in the Province of Avellino in Campania, the village is on the main highway route from Naples to Bari (in Puglia) - a route which is now part of the national 'autostrada' network - and is 36 kilometres East of Avellino. A settlement of over seven thousand people (1971 census figures), it is nestled on the slopes of the Úfita River valley at an altitude of approximately 400 metres above sea level on the Western side of the Apennines. The area is lightly populated and being of rather rugged terrain, presents few expanses of arable land. Prior to completion of the 'autostrada' some 10 years ago, the villagers seemed primarily to have been occupied in little better than

1. Reference will also be made from time to time to data recorded in the AIS (see bibliography) from the two closest villages to Grotta, p. 723, Montefusco, 13 km. west and p. 725, Trevico, 22 km. east. (See Maps 1 and 2). Data will also be presented from Napoletano, most of which was obtained from Mrs. Rosa Maria Rossi.

Map 1. Dialectal Zones of Italy

subsistence farming in addition to tending small flocks of sheep and pigs. With the improved lines of communication to the bigger centres, tourism contributes partially to the villagers livelihood as well as production of sheeps'-milk cheese and prepared sausages. As with many other less prosperous villages of Southern Italy, 'Rotø' (local name) has lost families by emigration. The last movement appears to have been in the late fifties when one group went to Canada and another to Australia. For all this the population has largely remained stable. It appears that income from expatriate EEC workers has arrested further departures.

1.3 The Informant

Our account is based almost entirely² on the speech of Mrs Maria Salza (née Guarino) aged 35, who came to Canberra from her native village 16 years ago. Up to that time she spent all her life in the village, had minimal education (primary) and did not and does not speak Italian, although of course she understands it completely. Both her parents and grandparents were natives of the village (only her mother survives) and spoke only dialect. On her arrival in Australia, she stayed several years with an uncle and aunt from the village and married a man from a village 7 km. distant from Grottaminarda. They speak dialect at home although both are quite fluent in English. There are more than 6 families from the village in Canberra who are in constant contact. The informant has never been back to Italy although other Grottaminardans here have made several visits there.

2. We have also used data collected at Edmonton, Alberta in 1971 during interviews with Pina Clericuzio who at that time was 23 years old and had been in Canada for 12 years. They spoke only dialect at home. We taped several of these sessions.

1.4 Elicitation Procedure

Latin word lists were compiled containing words with all the possible Latin vowel phonemes (long and short, free and checked, stressed and unstressed). The cognate Italian reflexes were then sought and the informant was asked the Rutés equivalent of these Italian words. In some cases the Rutés and Italian words were not cognate and the Proto-form (and thus proto-phonemes) was re-constructed from the modern reflex. In other cases the Italian word had no direct equivalent in Rutes and the informant asked for the English gloss - from which she supplied the dialect form, if one existed. The consonant phoneme inventory was obtained incidentally, as it were, from the vowel-oriented lists.

1.5 Italian Dialects : Place of Rutés within them

Dante was the first to recognise distinctions between the regional varieties of the Italian vernacular sufficient to divide the country into fourteen dialectal regions. In more recent times, scholars³ have drawn more general boundaries and the majority make three major divisions although there is some disagreement as to the membership within these groups. In all accounts, however, there is mention made of a distinct Northern Italian group. Other common headings are Southern, Central and Tuscan. Further evidence to support the separation of the Northern dialects from the rest is offered by Walther von Wartburg's (1967) 'La Spezia-Rimini'

3. Authors consulted were: Bertoni passim; Grandgent pp. 6-7; Meyer-Lübke p.12; Wiese p. 148.

hypothesis⁴. The remainder of peninsular Italy may be divided into the Tuscan dialect region, characterised by extreme conservatism, especially in the consonantism, with paradigmatic⁵ diphthongisation of the free stressed lower mid vowels (see below), and the Central and Southern groups. The latter heading, designated Area C on Map 1, oversimplifies the picture somewhat for expositional purposes⁶ as further elaboration would be beyond the scope of this paper. Our interest lies in the group we have called Central and identified on Map 1 as Area B - it coincides basically with Lausberg's Neapolitan type, - wherein Rutés falls. We classify dialects as Central when they satisfy two basic conditions, concerned with the reflexes of Latin vowels:-

- i) a 4 degree stressed vowel paradigm
- ii) the raising of higher-mid and diphthongising of lower-mid stressed vowels under conditions to be explicated below⁷.

4. The Northern or so-called Gallo-Italian dialects typically retain final -s of Latin Accusative Plural as plural marker for nouns, and voiceless intervocalic stops undergo lenition. Together with French, Spanish, Provençal, Portuguese, Catalan and Rheto-Romance they form Western Romance. South of this line fall the tongues he calls Eastern Romance.

5. Often called unconditioned (see Meyer-Lübke).

6. An exhaustive treatment of the Southern dialects is to be found by consulting the works of Lausberg and Rensch (see biblio.)

7. Some dialects show a conditioned change in the low vowel also - see Rohlfs, I. p. 16.

'Raddoppiamento' zone (Rohlf's)

$mb > mm; nd > nn$

$mp > mb; nt > nd$

(adapted from Von Wartburg 1967)

$p1 > [kj] < c1$ (adapted from Devoto and Giacomelli 1975).

Map 2. General Traits of Central Italian Dialects

1.6 The Consonantism of Central Dialects: Some General Traits

The whole of this region is characterised by lag assimilation of voiced stops to homorganic nasals⁸, i.e., mb>mm and nd>nn. This change has diffused also to the southern area of the Tuscan region and the northern area of the Southern dialect region. A similar assimilatory change, affecting again the manner of articulation with assimilation being only partial, occurs with voiceless stops preceded by nasals. The territorial diffusion of this habit is less extensive than that of the preceding one (see Map 2 and comments under Rutés consonantism). A third feature of a large part of the region, the southern half (see Map 2), is one it shares with the Southern group. Latin voiceless stop plus lateral clusters all merge into a sound we transcribe as [t̥]⁹, and shall discuss further below (Sect. 6.2.1).

8. Attributed by sub-stratists such as von Wartburg to the influence of 'osco-umbrian' speech habits.

9. Cf. Portuguese: chuva<plúvia, chave<cláve (also chama<flamma) - ch=[j], and Spanish: lluvia<pluvia llave<clave (llama<flamma)-ll = [ʎ] where merger occurs only in word initial position.

CHAPTER TWO

DIACHRONY I - CONSONANTS: RUTÉS REFLEXES OF LATIN PHONEMES2.1 Initial

2.1.1 Labials:

Latin	Rutés	Gloss
/p/	/p/	
pīlu	pel	hair
pōrtu	puərt (/pɔrtI/) ¹⁰	port
pēlle	pɛl	skin
pīſce	peʃ	fish
/b/	/v/	
būſcu	vusk (/voskI/) ¹⁰	wood
būcca	vok	mouth
bībere	vev	to drink

Note: There are a few words which retain initial [b] and we refer to them in Section 6.3 below.

/f/	/f/	
ēgo fáciō	iə fats	I do/make
fōcu	fuək ¹⁰	fire
/v/	/v/	
vōtu	vut (/votI/) ¹⁰	vow
vōce	voc	voice
vērme	vɛrm	worm

10. Our citation forms are presented in phonetic rather than phonemic transcription. Sometimes the two are identical. When they differ we have given some sample phonemic representations. The remainder may be established by reference to chapters III and VI below and are listed in phonemic form in the Appendix.

Latin	Rutés	Gloss
/m/	/m/	
míttēre	met	to place
mānu	man	hand
/p1/	/tj/	
plēna	tjen	full
plūmbu	tjumm (/tommI/) ¹⁰	lead
/b1/	/j/	
blōnda	jonn	blonde
blancu	jank	white
/f1/	/j/	
flumára	jumár	river
flātu	jat	breath
flōcca	jok	flake
/pr/	/pr/	
prēsbyter	priævet ¹⁰	priest
/br/	/vr/	
bracchiu	vrats	arm
*brōcculu	vruækæl ¹⁰	broccoli
/fr/	/fr/	
frīgidu	frid	cold
2.1.2 Dentals:	/t/	
tērra	ter	earth
tēmpu	tiæmb ¹⁰	time
2.1.3 Velars:		
*tór'lu	tuærl ¹⁰	yolk

Latin	Rutés	Gloss
/d/	/r/	
dŭlce	roc	sweet
dōte	rot	dowry
dēnte	rēnd	tooth
dīcere	ric	to say
/r/	/r/	
rŭssu	rus ¹⁰	red

Note: The mergers of Latin /b/, /v/ as Rutés /v/ and Latin /d/, /r/ as /r/ are almost complete; for exceptions see Section 4.4.

/l/	/l/	
lĕctu	liet ¹⁰	bed
/s/	/s/	
sĕrpe	sĕrp	snake
/n/	/n/	
nōcte	nōt	night
/tr/	/tr/	
*tropāre	truvá	to find
/sp, st, sk/	/sp, st, sk/	
spōrcu	spuærk ¹⁰	dirty
stōrta	stōrt	crooked
schōla	skōl	school
/spl, skl/	/ʃk/	
splūma	ʃkum	foam
sclaffu	ʃkaf	slap

2.1.3 Velars: /k/ + a, o, u

/k/ + a, o, u	/k/	
cōrnu	kuærn ¹⁰	horn
cālidu	kavər	cold
cultĕllu	kurtíel ¹⁰	knife

Latin	Rutés	Gloss
	/k/ + i, e	/c/
címice	cimēc	bedbug
cēdere	cer	to yield
	/g/ + a, o, u	∅ > /v/
gatta	at	cat
gallu	(v)al	rooster
*gūbitu (<cūbitu)	vut ¹⁰	elbow
ganeōne	vaʎón	boy

Note: The question of Latin /g/ before back vowels and its reflexes in Rutés is somewhat complicated and will be discussed in detail in section 6.3 below.

/g/ + e, i)	/j/	
)		
/d/ + i + vowel)		
)		
/i/ + vowel)		
gēneru		jener	brother-in-law
diŭrnu		jurn ¹⁰	day
iöcu		juæk ¹⁰	game

Note: i) gēneru: cf. p. 723 AIS (K.33) [o yēnnər⁰], p. 725

[l^u šyénərə] and Napol [jénnerə].

ii) Cases such as /ʃovən/ (<iúvene 'young) and /ʃóvərì/

(<Iōvis die 'Thursday) seem to be borrowings from

Italian - a tendency reported by Rohlfs (I, p. 211)

as occurring sporadically throughout the 'Mezzogiorno'.

	/kʎ/	/tʃ/	
*clövu		tuæv ¹⁰	nail (metal)
(e)clēsia		tes	church
	/gl/	/j/	
glacie		jac	ice

Latin	Rutés	Gloss
/kr/	/kr/	
crŭce	kroc	cross
/gr/	/(g)r/	
grössu	ruəs	big
grütta(*<crŭpta)	rot	'Grottaminarda'

Note: In predicate use the adjective requires initial /g/, whereas in attributive position it is omitted. Cf. perhaps the intermediate stage in p. 725 AIS [ɣrwóss°].

/k/ + u + a, o,	/kw/	
quáttuor	kwat	four
quánti	kwand	how many
/k/ + u + i, e,	/k/ (/c/)	
*(e)ccu-íllu	kir ¹⁰	that
quētu	cit ¹⁰	quiet

Note: We suggest that the general pattern is set by [kir], i.e., that by the time the [w] element had disappeared, the palatalisation of [k] to [c] had ceased. In the case of [cit] the [w] must have disappeared very early. Cf. Italian [kwello] and [keto].

2.2 Medial

2.2.1 Labials:

/p/	/p/	
nipóte	nəpot	grandson

Note: Words like [povər](<pāupere) and [vi]kəv](<(e)píscopu) are borrowings from N. Italy via Italian.

/b//v/	/v/	
carbōne	karavón	coal
böve	vov	ox

Note: The diphthong [au] (primary or secondary) is also a source of Rutes /v/. Thus: illà auríc'la>la avríc'la>la vret̥. Medially there are: cálidu>cal'du>caudu>kavər(ə) with vowel epenthesis to prevent an unacceptable cluster. Rohlfs (I, p. 67) attributes the au>av tendency to Greek influence in many cases. A third source of dialect /v/ appears in such examples as: vídua>verəv(ə) 'widow', where the epenthesis of a [v] prevents hiatus (See discussion of Velars below and section 6.3).

Latin	Rutés	Gloss
/f/	/f/	
scrōfa	skrof	sow

Note: Words containing this sound are not native to Latin, which had /b/ in 'naturalised' words; they are borrowings from the Osco-Umbrian dialects, and abound in the toponymy of the area.

/m/	/m/	
nōme	nom	name
/pɫ/	/t̥/	
cōpula	kɔt̥	twin
/bɫ/	/bj/or /ʌ/(converg. with l + ĭ + vowel)	
fīb'la	fibjə	buckle
něb'la	nɛʌ	fog
/f(f)ɫ/	/f̥/	
sūfflu	su ^f 10	blowing
/pr//br/	metathesis	
capra	krap	goat
fěbre	frɛv	fever

Latin	Rutés	Gloss
/p/ + ĭ + vowel	/c/	
sápio	sac	
/b/ } /v/ } + ĭ + vowel	ʃ	
hábeo	aʃ	I have
cávea	kaʃ	cage
/mp/	/mb/	
těmpu	tiəmb ¹⁰	time
/mb/	/mm/	
plūmbu	ʧumm ¹⁰	lead
/m/ + ĭ + vowel	/ñ/	
*vīndimīa	vənniñ	grape-harvest
2.2.2 Dentals	/t/	/t/
vīte	vit	vine
/d/	/r/	(cf. Tagliavini, p.106)
nīdu	nir	nest
*rādicā	rarək	root
/s/	/s/	
nāsu	nas	nose
/r/	/r/	
nōra	nər	sister-in-law
/l/	/l/ (sporadically /r/)	
dolōre	rəlor	pain
*nēspula	nɛspər	medlar
/n/	/n/	
cane	kan	dog

Latin	Rutés	Gloss
/t'1/	/t̥/	
vět'lu	viət̥ ¹⁰	old
/tr/	metathesis	
vītru	vrit ¹⁰	glass
/sp//st/	/sp//st/	
rōspu	ruəsp ¹⁰	toad
tōsta	tɔst	hard
/sk/ + a,o,u	/ʃk/ (?) (See 2.3 below)	
frěscu	friʃk ¹⁰	cool
/sk/ + e,i	/ʃ/	
pīsce	peʃ	fish
/str/	/st/	
nōstra	nɔst	our
/sc'1/	/ʃk/	
misc'lāre	miʃká	to mix
/r/ + cons	a) remains	
fūrnu	furn ¹⁰	stove
	b) vowel epenthesis	
carbōne	karavón	coal
/l/ + cons.	a) /r/	
scalpēllu	skarpíəl ¹⁰	chisel
	b) ∅ (vocalised and absorbed?)	
dūlce	roc	sweet
	c) >u>/v/ with epenthesis	
	(Cf. Labials above and Rensch §§201-6).	
*calceōne	kavətsón	shoe

Latin	Rutés	Gloss
/t/ + ĭ + vowel	/ts/	
*póteo	pɔts	I can
/d/ + ĭ + vowel	/j/	
hódie	vɔj	today
/s/ + ĭ + vowel	/s/	
básiu	vas	kiss
/r/ + ĭ + vowel	/r/	
dēnāriu	rɛnar	money
/l/ + ĭ + vowel	/ʌ/	
pálea	paʌ	straw
/n/ + ĭ + vowel	/ñ/	
rineōne	riñón	kidney
/nt/	/nd/	
dēnte	rɛnd	tooth
/nd/	/nn/	
vēndere	vɛnn	to sell

2.2.3 Velars

/k/ + a, o, u	/k/	
pécora	pekər	ewe
/k/ + i, e	/c/	
sórice	sóric	mouse
/g/ + a, o, u	∅ or /v/ or /j/	(See above and sect. 6.3 below)
a(u)gústu	aúst ¹⁰	August
*frágula	fravəl	strawberry
fatīgāre	fatijá	to work (Rohlf's I, p.299).

Latin	Rutés	Gloss
/g/ + i, e	/j/ or ø	
fugīre	fují	to flee
tēgēlla	tijél	pan (oven)
sūger	suær	cork
/kɫ/	/tʃ/	
pedūc'lu	pærut ¹⁰	louse
/gl/	/ʎ/ (confusion with /l/ + ʎ + vowel)	
rág'la	aráʎ	braying
*si(n)glútiu	siʎúts ¹⁰	hiccough
(cf. p. 723 AIS [suʎuttsá]; p. 725 AIS [səʎutts ^u])		
/nk//ng/	[ŋk] /nk/	
lōnga	lōnk	long
*cīnque	cink	five
/gn/	a) /in//a___ (cf. 18) below	
agnu	ain	lamb
	b) /ni// $\left[\begin{array}{l} +hi \\ -mid \end{array} \right]$ ___ (See sect. 3.4.3)	
*pūgna	pūniə	fist
	c) /vən/	
līgna	levən	wood (fire)
/gr/	/vər/ (Cf. /gn/)	
*nēgru	niəvər ¹⁰	black
/k/ + ʎ + vowel	/ts/	
brācchiu	vrats	arm
fācio	fats	I do/make

Note: This is the same reflex as Latin /t/ + ʎ + vowel. Rensch (§228)

observes that this merger occurs throughout Southern Italy.

Latin	Rutés	Gloss
/g/ + ĭ + vowel	/j/ (Cf. (/d/ + ĭ + vowel))	
corrĭgia	kuréj	belt

2.3 Palatalisation of /s/ before a Voiceless Stop

In treating the phenomenon in general, the following comment by Rohlfs is of major importance for the present discussion:

"...š nel Mezzogiorno compare sempre soltanto limitatamente in zone piú grandi o piú piccole, ma mai con diffusione completa su un ampio territorio, e inoltre non sempre si trova davanti a tutte le consonanti (I, p. 258)."

We note above in section 2.2.2 that in Rutés unconditioned palatalisation occurs only non-initially before /k/.

Rohlfs (loc. cit.) states that in Campania $s > \int$ before /p/ and /k/ but not before /t/. Our informant for Napoletano always gave $\int + p/k$, but sometimes gave $\int + t$! In Cilento (S. Campania) he says $s > \int$ especially before /k/, seldom before /p/ and never before /t/.

Our examination of the entries in the AIS for the points 723 and 725 reveal that the former shows palatalisation before /p/ and /k/ only, whilst the latter shows no palatalisation whatsoever.

Thus in Central Italy the minimal palatalisation environment is before 'k'. It seems possible that its appearance here may be linked with the evolution of $s + k$ before 'i/e'. (see 2.2.2 above and RSpr II, p. 49).

However sporadic the phenomenon may be, wherever it occurs, excluding Rutés, there appears to be an 'all and only' condition on the functioning of the process. It is indeed puzzling that this condition does not appear to hold for Rutés. If all $s > \int$ before /k/ we could assert plausibly that Grottaminarda is in a transition zone

between (almost) complete palatalisation to the west and Naples, and the absence of it to the east and Central Puglia. This is not the case, however, and the limitation to a non-initial environment, and then not always, seems to defy explanation. A closer examination of all the relevant data - vusk 'wood', freʃk 'cool', veʃkəv 'bishop' - few though they are, seems to indicate a possible phonetic conditioning factor, namely the preceding front vowel. This solution would certainly account for our data, although we can only propose it tentatively, lacking more corroborative evidence.

We consider $s > \int / _k l$ (pp. 10 and 15 above) as being conditioned in the form of an anticipatory assimilation to the following 'l' which appears to have palatalised in the formative years of the Romance vernaculars in much of Romania. In Rutés this 'l' was either absorbed or subsequently disappeared.

3)	Latin	Italian	Napolet.	Gloss
	vīnu	vino	vino	wine
	epīca	epiga	epika	ear(= corn)
	uva	uve	uve	grape
	fumu	fumo	fuma	spoke

11. We intend in no way to give the impression that these changes are unique to our Central Italian region, indeed, they represent the Vulgar Latin stage of development embodying the mergers that set the stage for further developments in all Western Romance.

CHAPTER THREE

DIACHRONY II - VOWELS - RUTÉS REFLEXES OF LATIN PHONEMES3.1 The Stressed Vowels

The modern Rutés reflexes of the Latin stressed vocalic system may be expressed schematically by the following metachronic equation:

2)	Class.Latin	\bar{i}	\bar{i}	\bar{e}	\bar{e}	\bar{a}	\bar{a}	\bar{o}	\bar{o}	\bar{u}	\bar{u}
			/			/			/		
	Central Ital	i	e	e	a	a	o	o	o	u	u
	i.e., Rutés ¹¹										

These are, of course, also the vowel phonemes of Modern Standard Italian. In some respects the evolution of the two vowel systems (Standard Italian and Central Italian) show parallel developments. If we restrict ourselves to the Central Campanian area of the Central region (using Neapolitan data at this stage) which is the emphasis of this paper, then the extreme vowels (both high and low) show the same modern reflexes:

3)	Latin	Italian	Napolet.	Gloss
	\bar{i}	i	i	
	vīnu	vine	vine	wine
	spīca	spiga	spike	ear(of corn)
	\bar{u}	u	u	
	ūva	uva	uve	grape
	fūmu	fumo	fume	smoke

11. We intend in no way to give the impression that these changes are unique to our Central Italian region, indeed, they represent the Vulgar Latin stage of development embodying the mergers that set the stage for further developments in all Western Romania.

Latin	Italian	Napolet.	Gloss
ā ā	a	a	
nāsu	naso	nasə	nose (s)
āpe	ape	apə	bee
lācte	latte	lattə	milk

It is in the evolution of the mid-vowels that the two systems diverge.

The following data serve to illustrate one of these divergences:

4)	fěle	fjɛle	fɛlə	gall (f)
	cōr(d)e	kwɔre	kɔrə	heart (m)
	věrme	vɛrme	vɛrmə	worm (m)
	sěrpe	sɛrpe	sɛrpə	snake (f)
	rōta	rwɔta	rɔtə	wheel (f)
	pětra	pjɛtra	prɛtə	stone (f)
	těrra	tɛrra	tɛrrə	earth (f)
	pōrta	pɔrta	pɔrtə	door (f)
	vět'la	vɛkkja	vɛkkjə	old (f)
	rōtae	rwɔte	rɔtə	wheels (f)
	dōrmo	dɔrmo	dɔrmə	I sleep

We note that the characteristic 'unconditioned' diphthongisation of the free lower mid (stressed) vowels of Italian (cf. French and Castilian) appears to be absent from Neapolitan.

Consider again:

5)	Latin	Italian	Napolet.	Gloss
	cōr(d)i	kwɔri	kwɔrə	hearts (m)
	vět'lu	vɛkkjo	vjɛkkjə	old (m)
	lěctu	lɛtto	ljɛttə	bed (m)
	fōcu	fwɔko	fwɔkə	fire (m)

Latin	Italian	Napolet.	Gloss
cōllu	kollo	kwolle	neck (m)
vĕrmi	vĕrmi	vjermə	worms (m)
dōrmīs	dormi	dwormə	You sleep

We see immediately that the diphthongisation pointedly absent in the Neapolitan data of 4) is here present in all the Neapolitan examples even when Italian does not allow it. If we had only the modern dialect as our source of information, the conditions under which Neapolitan has diphthongisation would be lost - the possible cause being obfuscated by the neutralisation of all word-final vowels. Although the examples in 5) are all masculine and show diphthongisation, there are two items in 4) which are also masculine but don't have diphthongs. A clue is provided by the morpheme that has allomorphs in both 4) and 5) - It. verme~vermi. The conditioning factor seems to be provided in the Proto-Language or Latin forms in the shape of the final (or last syllable) high vowels -ī (ĭ) and -ŭ, which in effect seem to exert an 'umlaut' influence.

3.2 Umlaut: General and Romance Manifestation

We have previously referred to 'umlaut' influence only in connection with the diphthongisation of certain stressed vowels. This is indeed a singular type of result for this type of anticipatory assimilation. Again the conditioning environments are rather unusual. Generally the phenomenon, a case of partial anticipatory assimilation at a distance, is identified with the familiar changes in the Germanic dialects, described by the term's originator,

Jakob Grimm.¹²

The evidence of incipient umlaut influence appears in Latin as early as Late Imperial times.¹³ The following examples are quoted by F. Schürer and H. Lüdtke¹⁴ and illustrate:

6)	CL	VL	Gloss
	fēcī	fici	I made
	vēnī	vini	I came
	bēstīa	bistia	animal, beast
	ōstīum	ustium	door
	lēgī	ligi	I chose, collected
	sēdī	sidi	I sat down

These data illustrate I-Umlaut with a raising effect. The same tendency was continued (or inherited) in Old French and in Spanish but absent from Italian, especially in the Perfect tense:

7)	CL	OF	Sp	Ital	Gloss
	fēcī	je fis	hice	feci	I made
	vēnī	je vinc	vine	venni	I came
	tēnuī	je tinc	----	tenni	I held

12. The phenomenon is often referred to as I-Umlaut and the assimilation is in the form of fronting or raising of stressed vowels, e.g., OHG helfan:hilfis, gast:gesti, loch:lochir (MHG lōcher), durch:durchil (MHG dūrkel). Cf. English foot:feet, man:men. Old Norse also showed U-Umlaut (see Bloomfield 1935, p. 381) as did Old English (King 1969, p. 61). See Icelandic in Anderson (1974, p. 141 ff).

13. Compared to its appearance several centuries later, in the Middle Ages, in West and North Germanic.

14. "La diphtongaison romaine", p. 119 footnote 1; Die strukturelle Entwicklung der romanischen Vokalismus, p. 77. Both have taken their examples from Schuchardt's Der Vokalismus des Vulgarlatein.

CL	OF	Sp	Ital	Gloss
*prēsī	je pris	prise (OSp)	presi	I took
*quēsī	je quis	quise	-----	I sought/ loved
(re)pōsuī	je repus	puse	posi	I (re)placed

The umlauted first person forms originally alternated with non-umlauted, third person forms but were subsequently analogically levelled with the raised-vowel form being generalised. Portuguese, however, still shows, in some strong perfects, the developing vowel alternations to which we have alluded:

8)	CL:I Sg	III Sg	Ptg:I Sg	III Sg
	fēcī	fēcīt	fiz	fêz
	pōsuī	pōsuīt	pus	pôs
	*pōtuī	pōtuīt	pude	pôde 'to be able'

It is Portuguese again that furnishes examples of a type of umlaut influence not seen elsewhere in Western Romance as the following examples show:¹⁵

(9)	CL	Ptg.	Gloss
a)	īpsu	isso	that (neut)
	tōtu	tudo	all, everything
	mētū	mêdo [među]	fear
	fōcu	fôgo [foɣu]	fire

15. Data from 9)a) are taken from C. Blaylock's "Hispanic Metaphony", p. 265, and 9)b) from Schurr p. 203. Metaphony is a term, fully explained in Blaylock's article, generally used by Romance linguists writing in languages other than German to refer to Umlaut in Romance.

CL	Ptg.	Gloss
b) trā(ns)věrsu	travêssu	naughty (maśc)
trā(ns)věrsa	travessa [traβɛsu]	" (fem)
mōrt(u)u	mōrto	dead (m.sg)
mōrt(u)os	mortos [mōrtuʃ]	" (m.pl)

Here we see that U-Umlaut has exerted a raising effect on the stressed vowels and taken on a morphological, although redundant, role. I-Umlaut, it appears, was limited in its influence largely to fossilised forms of the Perfect tense as shown in 7) and 8). The choice of 's' as the plural marker (See footnote 3 above) precluded I-Umlaut assuming a wider morphophonological role - the early neutralisation of final syllable Latin 'u' and 'o' seems to have had the same negative effect for U-Umlaut in most of Western Romance. The rest of the Romance languages show some type of umlaut influence, however vestigial. In South Sardinian the process is widespread,¹⁶ many Gallo-Italian dialects show its effect and its role in the evolution of the Romanian diphthongs is far-reaching.¹⁷

The fore-going brief sketch is an attempt to stress two points - that umlaut may be described as a pan-Romance phenomenon, at least in the formative stages of the Romance languages - and that where the process is still productive, it has not been phonologised, rather the alternations it produces are redundant since the conditioning factors are still present. Herein lies the major difference, we maintain, between what we have called pan-Romance umlaut and what we shall call Neapolitan umlaut.

16. H. Lausberg, *Romanische Sprachwissenschaft*, I, p. 168; Lüdtke, p. 89; Blaylock, p. 264.

17. Lausberg, I, pp. 170-1; Lüdtke, p. 97.

Our non-Neapolitan Romance data have illustrated umlaut of the raising type. We shall next furnish examples of the same process in Neapolitan.

3.3 Neapolitan Upper Mid-Stressed Vowels

In 2) above we indicated that the Latin high lax and mid tense vowels merged in both Standard Italian and Neapolitan (i.e., Central Italian including Rutés). The reflexes in unconditioned environments indicate this parallel development:

10)	Latin	Italian	Neapol.	Gloss
	nīve	neve	nevə	snow (f)
	pīsce	peʃe	peʃə	fish (m.sg)
	cēra	cera	cerə	wax (f)
	crēscit	kreʃe	kreʃə	he grows
	nūce	noce	nocə	walnut (f)
	būcca	bokka	vokkə	mouth (f)
	carbōne	karbōne	gravónə	coal (m)
	cognōscit	konóʃe	kunóʃə	he knows

When, however, we examine data displaying umlaut environments, the results are divergent:

11)	pīru	pero	pirə	pear-tree (m)
	pīsci	peʃi	piʃə	fish (m.pl)
	sēbu	sevo	sivə	suet (m)
	tēctu	tetto	tittə	roof (m)
	genūc'lu	ʒinókkjo	dənúkkjə	knee (m)
	plūmbu	pjombo	kjummə	lead (m)
	carbōni	karbōni	gravúnə	coals (m.pl)
	sōrsu	sorso	surtʃə	sip (m)

We may now extend the equation expressed in 2) above to include the conditioned reflexes shown in 5) and 11) above:

We have renamed the modern reflexes as Neapolitan as they are the ones represented in our data so far. Our decision to do so was largely motivated by our desire to present at least some data from a dialect already investigated (and which we verified independently through our Neapolitan informant). Rutés reflexes differ only slightly in that they show a further evolution of the lower-mid stressed vowels under umlaut conditions - an evolution that may be presumed to have gone through the following stages from the evidence furnished by various neighbouring dialects:

Stage VI indicates the phase reached by some dialects of the region, throughout Puglia, Abruzzo, Basilicata and Calabria¹⁸ - a situation that as yet does not obtain in Rutés, although in allegro speech the schwa is only just audible at times.

3.4 Rutés Unstressed Vowels

All the unstressed vowels in the dialects under study, with the

18. G. Rohlfs, Grammatica Storica..., I, p. 127.

exception of 'a' (<ǎ, ā) may weaken to the indistinct central vowel schwa - as they may in the whole area we have designated as Neapolitan. This tendency is more frequent with front rather than back vowels, however.

3.4.1 Prestressed Vowels

The four front vowels seem to merge regularly to schwa, thus:

14)	C.L.	Rutés	Gloss
	ī dīrēctū	rərɪt ¹⁰	right
	ǐ vidēre	vərə	to see
	ē dēnāriū	rənar	money
	ě *pědŭc'lu	pərut ¹⁰	louse

Note:

There are some cases when the reflex is not a weakening and centring but rather a raised vowel 'i'. This always occurs before a palatal element and thus we attribute the seemingly exceptional evolution to anticipatory assimilation to the following high-tongue position:

15)	C.L.	Rutés	Gloss
	dĭsiūnu	rijún	fast
	sĭ(n)glŭtiū	siλúts ¹⁰	hiccough
	fatĭgāre	fatijá	to work

A further case of assimilation, both lag and anticipatory, appears to affect the evolution of C.L. 'ĭ' and 'ě' when they are in the vicinity of a labial consonant:¹⁹

19. Cf. Rohlfs, I, p. 169.

(16)	C.L.	Rutés	Gloss
	(um)bǐlǐcǔlu	vulíkæl	navel
	věscǐca	vusík ¹⁰	bladder
	blastimǎre	jastumá	to blaspheme

The four back vowels also merge, but less often to schwa. The more frequent reflex appears to be the high back vowel 'u':²⁰

(17)	C.L.	Rutés	Gloss
	ū mūtáre	mutá	to change
	ǔ cǔltéllu	kurtíel ¹⁰	knife
	ǒ dǒmēnica	ruménæk	Sunday

Note:

dǒlǒre	rǎlor	pain
pǔlmǒne	pǎrmon	lung

In some cases there is a tendency for these back vowels to open to 'a' - we cannot, in light of the evidence, see the reason for this change:

(18)	C.L.	Rutés	Gloss
	cǒgnátu	kainát	brother-in-law
	ǒccǐdere	acír	to kill
	ǔncǐnu	ancín	hook

The low vowel 'a' is the only one that is consistently preserved in pre-tonic position:

20. Cf. Romanian in Lausberg, I, p. 203.

21. See also sect. 2.2.1 (medial labials) above and sect. 5.3 below.

19)	C.L.	Rutés	Gloss
	*phase [́] o [́] li	fas [́] ul ¹⁰	beans
	cannar [́] one	kanar [́] on	windpipe

The Latin diphthong 'au' normally merged fairly early with the lower mid 'o' when stressed, but in atonic position, especially when word-initial, its evolution varied in Rutés:

20)	C.L.	Rutés	Gloss
	*auc [́] ellu (avic [́] ellu)	auci [́] el ¹⁰	bird
	aug [́] ustu	a [́] ust ¹⁰	August
	aur [́] ic'la	vret [́]	ear

In the first case the main form is from Late Latin and perhaps, as the diphthong is secondary, it appeared in dialect too late to participate in changes that the primary diphthong underwent. The second case is generally considered to be the result of dissimilation, an intermediate stage being perhaps '*agustu' and then the intervocalic stop lenites completely. The last example appears to be the result of a consonantisation of the 'u' and then perhaps a re-analysis of the form with the article from 'l'avric'la' to 'la vric'la'.²¹

3.4.2 Poststressed Vowels

The vowels following the stressed syllable undergo complete neutralisation and are all realised as a schwa. Final vowels are almost invariably dropped completely, the schwa articulation only re-appearing as a sort of voyelle d'appui when the following word begins with a consonant:

21. See also sect. 2.2.1 (medial labials) above and sect. 6.3 below.

21)	C.L.	Rutés	Gloss
	ī ferōcī	fəruc ¹⁰	fierce (pl)
	ī crēdīt	krer	he believes
	ē cānē	kan	dog
	ē Mērcū(ri) diē	míærkuri ¹⁰	Wednesday
	a cōda	kor	tail
	ō párlō	(iə) parl	I speak
	ū caecātū	cækat	blind

3.4.3 Proparoxytones

Words originally stressed on the antepenult syllable, with the loss of the final syllable, become paroxytones:

22)	C.L.	Rutés	Gloss
	frāgūla	fravəl	strawberry
	dēbitu	riəbet ¹⁰	debt
	sōrice	sorəc	mouse
	mōnachī	muənəc ¹⁰	monks

Note: pūgna > *púina > púniə (see p. 17), as a modern proparoxytone, is an exception to the statement in 3.4.2, and as such, does not come under 3.4.3.

22. See Lausberg, III pt. 1, p. 19 and R. Posner, *The Romance Languages*, p. 137.

23. Posner, loc. cit.; cf. Lausberg, II, p. 82.

CHAPTER FOUR

THE MORPHOPHONOLOGICAL RAMIFICATIONS OF UMLAUT IN RUTÉS4.1 The Nominal Sub-system

With the effacement of final -s in Eastern Romance and subsequent case syncretism, distinctive markers crystallised for both gender and number in the endings retained by the 2 major representatives - Romanian and Standard Italian. The subsequent effacement of final vowels in Rutés, however, appeared to lead to the strengthening and extension of the phonetic alternations brought about by umlaut assimilations.

Eastern Romance established basically 2 nominal patterns (Declensions?) divided on the criterion of gender. To the Latin 1st Declension belonged Feminine nouns - these are the -A nouns, whose singular ending may have come from Latin Nom. -ā or Accus. -ā(m) and whose plural in -E may be a reflex similarly of Latin Nom. -ae or Accus. -ās²² in the Italian peninsula. The so-called 0- or 2nd Declension contained Masculine nouns. In Standard Italian the singular form may have come from any case except the Genitive - N. -ū(s), Acc. -ū(m), D-A. -ō. The plural in -I is considered to be a reflex of either the Latin Nom. -ī, or Accus. -ōs. The latter is held to have developed through the stage -oi>i²³. In our oversimplified synopsis we have excluded the heterogeneous, often called consonant, Latin 3rd Declension. In Italian the singular form, be it Masc. or Feminine, generally ends in -E, which may be from Latin Nom., Gen. -ī(s) or Accus. -ē(m), while the plural ends in -I, styled either analogically

22. See Lausberg, III pt.1, p. 19 and R. Posner, The Romance Languages, p. 137.

23. Posner, loc. cit.; cf. Lausberg, II, p.82.

on the -O noun plurals or from Latin Nom.- $\bar{e}s$ or Accus.- $\bar{e}s/\bar{i}s$ (i.e., $\bar{e}s > \bar{e}i > i / \bar{i}s > \bar{i}i > i$)²³. We will deal with the fate of the Latin Neuters by reference to individual cases in Rutés.

We thus see that potential umlaut environments are offered in both singular and plural of -O nouns, and in the plural of the consonant (stem) nouns. We shall now examine the data from Rutés to see whether phonological evolution as reflected by umlauted or unumlauted vowels proceeded unimpaired by non-phonological pressures.

In Table I we observe that phonological pull has held sway everywhere in the data. It is also noteworthy that our singular form may have only come from either the Nom or Accus. Latin forms and thus it may be more aptly called the class U-nouns.

In Table II we have arbitrarily chosen the -ae form as the source of the plurals - it may just have easily have been the - $\bar{a}s$ form, as we have mentioned. We shall elaborate on the underlined forms when we deal with allophonic variation below (sect. 6.3).

The Latin boxed forms in Table III appear to have followed the evolution we have posited for Standard Italian with the result that we have a class of nouns with internal inflection for number in Rutés. Again phonological pull has prevailed with the -i plural becoming the plural-marker for all regular Masculine nouns.

Supposing we accept the theory that attributes the plural -i of 3rd Declension nouns in Italian to a natural phonetic outcome of the Latin - $\bar{e}s$, or sometimes - $\bar{i}s$, (see p. 32 and above) the data in Table IV show examples where this natural evolution has been inhibited, for with an underlying -i, we would again have umlaut assimilation and thus internal inflection as with the examples in Table III above. Similarly an endorsement of an analogically-formed plural in -i would yield alternating forms. Thus we would expect: illá núce > la noc and

Table III - MASCULINE 3RD DECLENSION (UMLAUTED) NOUNS

and illāē *núcī>rē *nuc, etc. This is apparently the evolution in Italian where we have: la noce ~ le noci.- gender marker thus residing in the article, or an -A class modifier, in the plural. What is striking and extremely significant for this study is that the modern Neapolitan forms seem to go back to the same proto-forms as the Italian ones, so that we have: a nocē ~ e nucē. This is not say that all our forms in Table IV would show unlauded plurals in Neapolitan - apparently only those having [e] or [o] (<Lat. ĭ, ē; ŭ, ō) show umlaut effect (see Rohlfs, I, p. 17). Hence we would perhaps call the boxed forms of Table IV 'Proto-Grotta' rather than Proto-Nap. The fact that the open vowels [ɛ], [ɔ] (<Lat: ě, ǒ) generally do not apparently yield to umlaut influence may either indicate the i- plural was not generalised to these forms (a remote possibility) or a different chronology for umlaut diphthongisation as compared with umlaut raising (see Chapt. 5 below). Again it may be linked in some way with the fact that the plural article is undifferentiated for gender in Neapolitan, thus: e pullicē (m) 'the fleas'; e ddetē (f) 'the fingers' (Cf. Mod. French). In the major framework of Italian, or Eastern Romance generally, and Neapolitan Romance in particular, in respect to the Feminine plurals of 3rd declension nouns, therefore, the the Rutés system is unique. It may even be that Rutés generalised the 1st Declension plural ending to all Feminine nouns, i.e., ē(s)>ae>e, the result would have been the same. Thus we maintain that a positive consciousness of gender inhibited 'umlaut endings', indistinguishable phonetically from typically Masculine endings, from 'encroaching' on Feminine territory, as it were (see further comments under sect. 4.4 below).

The four previous groups we have discussed seem to be open classes of nouns that are more or less productive patterns. The data of Table V forms a closed class of relics from Latin Neuter nouns. As

Table V - NEUTER '2ND' DECLENSION (UMLAUTED) NOUNS

we see, the singular becomes Masculine, that is, falls in with the data of Table I (singular) and the plural, although we have posited and underlying -a ending, would more accurately be represented with -ae, thus having the Feminine plural of Table II. All of the nouns cited, with the exception of 'hörtu' and 'trönu', have or had -a plurals in Italian which are preceded by the Feminine plural article. The characteristics of this sub-class are the reverse of those in Table III - the singular shows umlaut effect whereas the plural shows none.

Table VI - MASCULINE 2ND DECLENSION (IRREGULAR)

We shall discuss each of these items one by one in order to try to establish why the singular forms do not show umlaut influence.

'pr̄esbyte': this word is included in this list although it more resembles a 3rd Declension than 2nd noun. We suggest the form, a Nominative rather than Oblique one, reflecting a Vocative function, which is fairly common with nouns 'capaci di presentarsi come soggetto agente' says Rohlfs (II, p. 6) and which are likely to be in frequent use in forms of address (cf. Rutés: patēm̄ 'mio padre' matēm̄ 'mia madre' fratēm̄ 'mio fratello' sorēm̄ 'mia sorella').²⁴ Our 2nd Declension model would be 'puer'.

'magīstru': this form may also disguise what is really a modified Vocative. Perhaps '*magīstre' would be a better underlying form, where the Nominative form 'magister' has undergone metathesis of the two final phonemes.

'ep̄iscopu', 'm̄edicu', 'm̄onachu: these forms are more easily accounted for if we posit an underlying Vocative, on the model of 'm̄urus~m̄ure' so that we may eliminate the umlaut environment from the singular.

's̄ociu': Superficially we may easily include this noun with the preceding three. The Vocative was 's̄ocī' however, which still presents umlaut conditions. We must therefore posit an analogical Vocative '*s̄ocie' to provide a possible explanation for the alternation.

'sp̄o(n)su': We treat this noun separately from the others, although it also presents the Vocative possibility, since the form 'la spos' also exists. The plural 'li spus' seems generally to mean 'newly-weds' rather than 'bridegrooms'.

'p̄ira': is a special case on its own. It is the crossing of two separate nouns. The original name for a pear-tree was 'p̄irus' and was Feminine, as were all fruit-trees, (it was 4th Declension) and

24. Cf. also the avoidance of word final /tr/ or /str/ clusters in 2.2.2 above.

on being identified with the 2nd Declension (O-nouns) became Masculine. The pear was 'pīrum' Neuter, giving 'pīra' pears. The plural became identified with the A-nouns, which were Feminine, and was used as the singular. It then 'borrowed' a Masculine plural form. 'dēbitu': this noun was Neuter in Latin, and, based on its plural in -a, became Feminine in the modern Romance Languages (cf. French 'la dette', Ital. 'la detta'). If we posit *debita as the underlying singular form, then no umlaut would, of course, occur in Rutés, as is indeed the case. This leaves the reason for an umlauted plural unexplained. It is probable not a native word, as it is only partly assimilated phonologically (d>r, b/v) and perhaps was borrowed with 'mixed' forms.

For remaining five nouns, it seems impossible to account for their internal inflection by means of the explanations proposed for the 'person' nouns. They should belong to the class of Table I above - i.e., unimpaird phonological evolution would have yielded metaphonised forms both in singular and plural. There is no apparent semantic link between these nouns that may suggest a special class be set up. We would like to suggest tentatively that the data of Table III represents the dominant, even productive, type of Masculine noun which either is attracting or has attracted some Masculine nouns of the 2nd Declension type. We would thus propose that we have here another example of the 'regularising' effect of morphological pull.

4.2 Adjectives

There are two classes of adjective in Rutés. The major class embraces the Latin 1st and 2nd Declension type. It has marking for gender. The other class reflects the 3rd Declension type and marks

Table VIII - ADJECTIVES: 3RD DECLENSION

number. We illustrate above in Tables VII and VIII. These data do not in themselves add anything new to our comments concerning umlaut. It may be noted that phonological evolution has proceeded everywhere unimpeded by morphological constraints. The salient feature of the system we have tentatively called the Masculine (dominant and/or productive) class seems to be emphasised by the examples in Table VII - the phonetic diphthongs [iə] and [uə] are striking gender markers.

4.3 Verbs

Although again the verbal morphology does not contribute any new phonological information to this discussion, it does offer further examples of the extent of umlaut influence whilst at the same time providing an interesting resolution of the four Latin conjugations which we have not observed elsewhere in the literature consulted. We shall restrict our examination to the Present Tense. See Table IX. We consider three points worthy of comment:

- a) the four Latin conjugations are reduced to two in the following manner:

-A Conjugation > -a -Ē, -Ī Conjugations > -i

- b) Latin infinitival ending -re is lost everywhere.²⁵
 c) umlaut effect is shown in both conjugations in 2nd Pers.

Sing. and 3rd Pers. Plur.

The third point merits a more detailed examination. Latin presented the following pattern in these persons for the four conjugations:

23)	I	II	III	IV
2nd Sing.	spērās	tēnēs	vëndīs	dōrmīs
3rd Plur.	spērānt	tēnēt	vëndūnt	dōrm(i)ūnt

Table IX - VERB CONJUGATIONS IN RUTÉS

Note: These forms are in phonetic transcription (including the infinitives). A phonemic representation would require additional P Rules involving the shifting stress patterns in verbal paradigms - we do not consider such details germane to the present discussion.

The boxed forms alone would have produced umlauted vowels. Thus the 4th Conjugation ending must have been generalised throughout for the 2nd Singular and the 3rd Conjugation ending for the 3rd Plural to yield the Rutés forms. Whilst we note that the 2nd Singular innovation is common also to Standard Italian and it appears to be so in all Eastern Romance including the Italian dialects, the 3rd Plural innovation, although common also to Rhaeto-Romance,²⁶ French and Provençal,²⁷ seems only to undergo umlaut influence in the dialect under study and a restricted part of Central Basilicata where Latin -ant is also replaced by -unt.²⁸ In the remainder of Central and Southern Italy where -ant is retained, -unt has umlaut effect only in the extreme south of the Marche, in the Abruzzi, Lazio from Rome south, and of course, Central Basilicata.²⁹ Grotta seems to fall on the northern limit of the sphere of influence of the latter zone.

4.4 Feminine Plural Nouns - A Counterpart to Masculine Umlaut?

A superficial glance at the morphology of the noun in Rutés would seem to suggest that what we have called the dominant Masculine pattern, that of Table III, has clear number marking whereas the Feminine nouns don't. We suggest that this seeming discrepancy is more apparent than real. We have assembled in Table X the underlined

Table X - FEMININE PLURALS

forms from Tables II, IV and V above with some additions.

We have seen above (pp. 4-9) that the Latin voiced stops underwent some transformations in Rutés, be it lenition, as in the cases of the labial and velar before back vowels, or change to a flap as the dental. We see that the original (Latin) values are 'retrieved', as it were, when word initial and preceded by the Feminine plural article 'rə'. Whilst the speaker is quite conscious of this alternation, he is not aware of any differences involving the voiceless stops or affricates. Rohlfs says 'l'articolo femminile plurale produce raddoppiamento della consonante che segue...'.³⁰ The same phenomenon is described by Devoto and Giacomelli³¹ as 'rafforzamento' produced 'per ragioni di fonetica sintattica.' Although the phenomenon described by these observers appears to apply to all initial consonants, our investigations would seem to indicate that it is restricted to the stops and affricates in Rutés. Rohlfs further notes that 'per effetto del raddoppiamento 'v' diviene 'bb', la fricativa 'ɣ' diventa 'gg', e l 'r' derivante da 'd' si trasforma in 'dd'.³² Thus all surface 'v's become 'bb'. Rutés differs here in that only where surface /v/ is from an etymological (i.e., Latin) [b], does 'rafforzamento' produce [b]. There are three apparent exceptions in our data. The first 'bamb' (<*vampae) is itself a neologism. It appears to be a crossing of Latin 'lampa' and 'vapor'³³ and we would attribute the 'b' to folk etymology. We may also explain 'vut' (<*gūbitu) becoming 'bot' similarly (see sect. 6.3

30. II, p. 107.

31. I dialetti delle regioni d'Italia, p. 113.

32. II, p. 107, n. 5.

33. Avviamento alla etimologia italiana, p. 450.

below) although the fact that it is of 'mixed' gender may play some role. The third example 'bret̥', also a false etymology, may be 'constrained' to retrieve 'br' as 'vr' did not occur in Latin. Thus Rutés /v/, from Latin /v/, e.g., voc<v̄oce, does not retrieve [b] in the Plural. Rutés agrees with the general process with regard to /r/ (from etymological [d]) becoming [d]. The only exception 'd̥enot̥' is based, as indicated, on a form '*denúć'la'. The innovation in the initial consonant is not peculiar to Rutés and Rohlf's³⁴ suggests it may be due to an ancient dissimilation. We defer discussion of the velar, which is rather complex, to section 6.3 below.

It is the opinion of Rohlf's and others cited by him³⁵ that this 'raddoppiamento' may be explained on purely phonetic grounds. Thus a hypercorrect '*illēs' (<*illaes) may have produced a re-analysis so that Feminine consonant-initial plural nouns then began with a consonant cluster of which the first sound was 's' which by assimilation to the following consonant, re-enforced or doubled it. Inscriptions contain examples of this hypercorrection and the solution explicit in the aforementioned hypothesis seems quite acceptable. We suggest, however, that this innovation, at first really phonetic, took on morphophonemic significance in, at least, the Rutés nominal sub-system. We suggest our hypothesis is further supported by the change of 'l' to 'r' in the Feminine plural article in Rutés. This change, a feature of limited geographical distribution,³⁶ seems to add further weight to a morphological basis for specially marking the Feminine plural. We

34. II, p. 108.

35. loc. cit. He mentions Schuchardt, Meyer-Lübke and Merlo.

36. Rohlf's, II, p. 110, only mentions Treviso (prov. Avellino), which we were able to confirm as it is p. 725 of the AIS.

submit that as Masculine nouns are typified by the phonetic diphthongs, so Feminine nouns are typified always by a special article, and sometimes by consonantal re-enforcement or 'retrieval' in their plurals.

4.4.1 Feminine Singular Lenition

A further peculiarity of the consonantism of Feminine nouns was noted when forms were elicited with initial voiceless stops and affricates. In the singular there seemed to be lenition occurring with the effect that these voiceless phonemes were becoming voiced. Thus we heard the last twelve forms in Table X as having voiced initial sounds. This was apparently a subconscious process to the speaker who insisted that the sounds in question were voiceless.

Thus it appears we have a further morphologically conditioned change which increases the distinction between singular and plural in this sub-class. We were unable to detect any parallel process affecting the fricative-initial lexical items, but as our examination was less than exhaustive in this aspect a closer study needs to be made before the whole pattern can be discovered.

If we do not accept the morphological motivation of this lenition, but instead seek a phonetic conditioning, it would appear very difficult to account for the fact that Masculine nouns or indeed all word-initial intervocalic voiceless stops and affricates are not affected.

CHAPTER FIVE

RUTES UMLAUT AND ROMANCE DIPHTHONGISATION

It is beyond the scope of the present study to treat the topic of our heading in depth - we shall restrict our discussion to a brief review of the positions of some previous investigators. Schürer (1956) attributes all Romance diphthongisation to a generalisation of that conditioned by umlaut. At the other end of the spectrum we have Romeo's paradigmatic explanation,³⁷ according to which all four degree vowel systems, due to structural pressures, underwent diphthongisation in the lower (and sometimes upper) mid orders. Where diphthongs no longer appear in four degree systems, it is because they have undergone a re-monophthongisation process. He does not even acknowledge, therefore consider, diphthongisation through umlaut. As though a compromise between the two extremes we have the contributions of Lausberg (1947) and Lüdtke (1956) who would attribute what we may call umlaut-induced diphthongisation (as seen in Rutes) to a structural pressure to avoid the merger of a phonetic [e] and [o] (caused by umlaut closing influence on /ɛ/ and /ɔ/) with a phonological /e/ and /o/ (<Latin ĩ, ē and ŭ, ō respectively). We assume that umlaut diphthongisation systems and diphthongisation of the Tuscan (Italian or unconditioned) type are mutually exclusive and that the former, an earlier innovation, precludes development of the latter type?

The question of the relative chronology of umlaut-induced changes and spontaneous diphthongisation has never been satisfactorily answered although some clues are provided by evolutionary evidence from some South Italian dialects. We have already noted that there was evidence of umlaut influence in Latin Imperial times (sect. 3.2 above). Rohlfs (I, p.14) notes that secondary 'i' and 'u' (from

umlauted Latin \bar{e} and \bar{o} resp.) take part in all changes that affect primary 'i' and 'u' (from Latin \ddot{i} and \ddot{u}). There is no early evidence however, of the effect of umlaut on the mid open vowels 'ε' (<ě) and 'o' (<ö), hence the Lausberg-Lüdtke hypothesis, although Rensch (pp. 26, 30) does prove that what he calls umlaut (i.e., raising) is earlier than diphthongisation (conditioned by umlaut) in the dialects he reports on.

The apparent counter-examples to what we have called the mutual exclusiveness of conditioned vs. unconditioned diphthongisation (of the Italian type), offered by Rensch (pp. 25-6), are admittedly not phonetically conditioned, but the very fact that the 'irregularity' is restricted to a part of a morphological sub-class seems to us to point to a morphological conditioning.

6.2 The Phonemes of Rucés

Rucés has a total of nineteen consonant phonemes, including the doubtful /g/. There are seven vowel phonemes in stressed syllables which we increase to eight with the inclusion of the unstressed /ə/. In Table XI we classify these phonemes using articulatory terms, etc.

CHAPTER SIX

SYNCHRONY6.1 Underlying Forms in the Rutés Lexicon

There are two possible ways to represent the lexicon of a language - either by surface (i.e., phonetic) forms, or by more or less abstract forms. The only reasonable justification for the latter method, it seems, is when such forms simplify in some way the grammar of the language. We feel that the vocalic and consonantal alternations (primarily) of the substantival sub-system of Rutes can best be represented by excluding these predictable (allomorphic) variants from the phoneme inventory and having recourse to historical motivation for such variations. Thereby structural relationships that otherwise may have been obfuscated will be made apparent. In the case of Masculine nouns (and verbal paradigms) we shall show the internal inflections to be conditioned by an umlauting vowel (see PR 1 and 2) and a 'reinforcing' determiner (the definite article) for Feminine plurals. The base for Class I adjectives (Table VII) would thus be the Feminine, that of Class II (Table VIII) the Singular form.

Notes: 1) Forms shown in square brackets are allophones of certain

6.2 The Phonemes of Rutés

Rutés has a total of nineteen consonant phonemes, including the doubtful /g/. There are seven vowel phonemes in stressed position which we increase to eight with the inclusion of the unstressed /ə/. In Table XI we classify these phonemes using articulatory parameters.

6.2.1 The Phoneme /w/

As mentioned above (Chapter 2) this phoneme is the reflex of the merger of three Latin consonant clusters. We are proposing here that the resulting sound is an innovation and not the absorption of two sounds by a third.

I CONSONANTS

	Lab	Dent	Pal	Vel

Notes: i) Forms shown in square brackets are allophones of certain phonemes (See Sect. 6.3).

ii) /c/ = [t̟]; /ʧ/ = [dʒ]

Table XI - RUTÉS PHONEMES

6.2.1 The Phoneme /t̟/

As mentioned above (Chapter 2) this phoneme is the reflex of the merger of three Latin consonant clusters. We are proposing here that the resulting sound is an innovation and not the absorption of two sounds by a third.

It has been generally accepted by Romance scholars and Italian dialectologists that a [kj] (<cl) absorbed a [pj] (<pl) and a [tj] (<t'l) (see our Map 2; Devoto and Giacomelli p. 115; Bourciez p. 48; Pei p. 157; Tekavčić I, p. 73). All investigators, however, do not agree on the exact nature of the resultant sound. Those just mentioned identify it completely with the Latin 'cl' (and 't'l') reflex in Italian, namely [kj]. The authors of the AIS invent a new symbol [č'] for the sound in question which they describe as a "stimmloser mediopalataler Quetschlaut" (Jaberg and Jud, *Der Sprachatlas*...., p. 27). Rohlfs (I, p. xxxv), the AIS investigator for Southern Italy, describes it as an 'affricate mediopalatale sorde (simile al suono iniziale di 'chiamo' = čamo)'. Rohlfs' eminent student Lausberg gives the only description of [č'] with explicit articulatory parameters, saying it is produced by 'der Verschluss der Vorderzunge mit dem Vordergaumen' (RSpr. I, pp. 86-7). He adds that often the sound is realised as an affricate when the release is not quick enough - the stop being followed by the palatal fricative [ç]. Rensch indicates that the sound is definitely a palatalised velar in the area he investigated (personal communication).

Our informant produces a sound we would describe as a voiceless alveolo-palatal stop. The auditory impression was clearly distinct from a palatalised alveolar stop [tʃ], the palatoalveolar affricate [tʃ], the palatal stop [c] and a palatalised velar [kʲ]. On the rare occasions when we detected a fricative release (word lists normally yield a more guarded pronunciation) we would transcribe it as [ç]. We chose therefore not to continue the tradition of using [č'] since we feel it identifies a medio-palatal sound. Thus, in using the symbol /tʃ/, we do not intend to indicate a palatalised 't'. We have attempted to locate the place and illustrate the manner of articulation

of this phoneme in Figure 1. We have compared it with the sound /c/ designated by the superimposed broken line. It will be noted that our /t̥/ is laminal, whereas /c/ is essentially apical.

Figure 1. Tongue Position of Grottaminarda /t̥/ compared with that of /c/.

6.3 Allophones and Anomalies

The voiceless consonant phonemes /t̥s, t̥, s, f/ each have a voiced allophone when they follow a nasal. Examples were rather sparse and, in the case of the fricatives, the result of a peculiarly South Italian fusing process:

23)	/t̥s/	*pánti(c)e	[pandz]	'belly'
	/t/	*amplátu	[anʃát]	'swollen'
	/s/	in-sínu	[nzín]	'lap'
	/f/	{ in-fössu	[mvuəs]	'wet'
		{ in-fúndu	[mvunn]	'deep'

Of the remaining voiceless consonants, /p, t, t̥/ undergo no purely phonological modifications (See Sect. 4.4 above and 6.8 below) and /k/

seems to undergo neutralisation with etymological 'g' when post-nasal in final position, thus:

24)	*cinque	cink	[ciŋk]	'five'
	sangue	sank	[saŋk]	'blood'

As these examples illustrate /n/ has a velar allophone before a velar stop. The situation with the voiced consonants /v, r, g/ is less straightforward. The phones [v] and [b] are in complementary distribution, as are [r] and [d]. The first partner of each pair appears in the less restricted environments and thus is our choice as phoneme. [b] only appears after nasals (see also sect. 4.4 above) and [d] only after nasals or [r]. There appear to be no exceptions for /r/, but /v/ does appear to have the following counter-examples:

25)	Rutes	Napol.	Ital.	Gloss
	bɛl	bbjélle	bélllo	beautiful
	buən	bbwónə	bwóno	good
	barba	bbarbə	bárba	beard
	barbét	varvə	mɛnto	chin

These are all words of common occurrence and there seems no phonological explanation for the initial Latin /b/ not to have undergone lenition. From dialectal evidence, however scarce, supported by toponyms, it seems that these forms are borrowed from Italian and not indigenous.³⁸

'bel' is immediately suspect as we would expect an umlaut-induced diphthong. The forms for p. 723 AIS for 'barba' and its derivative - [varv^a][varvét^a] - show normal S. Italian evolution. Rohlf's³⁹

38. Rohlf's. I, p. 195.

39. I, p. 196.

notes that this Italianisation of dialectal vocabulary where /v/ re-becomes [b] is common in all the dialects of S. Italy.

The velar /g/ is of doubtful status - we posit it on the strength of just three occurrences:

26)	Rutés	Ital.	Gloss
	goc	goccia	drop
	gol	gola	throat
	{lagəne	(lazáne)	lasagna
	{làgənatúr	(matterélllo)	rolling-pin

The first is suspect as native since normally Latin $-(t)tia > ts$ in Rutes (goccia < gütia). The second is suspect on lexical grounds as Southern dialects generally use a form or compound of 'canna' - cf. Napol. ncanna 'throat'.⁴⁰ The third example and its derivative seem to be indigenous.

Generally etymological /g/ (+ a, o, u) is very unstable (see sects. 2.1.3 and 2.2.3 above) and either disappears completely or 'changes into' /v/ in initial position. Intervocally, as already shown, it may become \emptyset , /j/ or /v/ - statistically the last is more frequent. Dialects in the region seem to indicate that Latin /g/ first lenited to [ɣ].⁴¹ The step from there to [v] is not clear. Rohlfs sees it as the 'inserzione di un suono di transizione.....(in) posizione (di) iato' (I, p. 208). Thus he sees the process as: $g > \gamma > \emptyset > v$. Rensch notes (§ 127) numerous cases of $v, \beta > \gamma$ and says the reverse 'Austausch' of $\gamma > v, \beta$ is just as common. It appears therefore that perhaps we have a case of confusion of two sounds. We list our total corpus of

40. See also Rensch, p. 248.

41. Cf. Rensch, pars. 126 and 194; Rohlfs, I, pars. 155 and 217.

words having Latin or prior initial /g/:

27)	Latin	Rutés Sg.	Rutés Pl.	Gloss
	*gūbitu	lu vut	rə bot	elbow (Table X)
	gatta	la at	rə gat	cat (f) "
	gunnēlla	la unél	rə vunél	skirt "
	gallu	lu al	li val	rooster "
	(gur)gūtia	la vots	-----	goiter; crop
	*galeōne	lu vaλón	li vaλún	boy
	(<ganeōne)	(Cf. p. 725	AIS [wañónə])	

The first example in 27) has already been cited and, as a case of what Rohlfs calls 'false ricostruzioni', may be handled under the phoneme /v/ (the former [g] being purely of historic interest). In the same passage (I, 208) Rohlfs cites a concrete example of what we have called 'confusion' - at Monte di Procida (nr. Naples) we have: a vatt 'la gatta', rə ggatt or rə bbatt 'le gatte'. As with 'lu vut' so 'la vots' and 'lu vaλón' may be assigned to /v/. The remaining examples 'la at', 'la unél' and 'lu al' must be marked as having anomalous plurals. The only example of correct etymology in the case of Feminine plural 'rə gat' is unfortunately insufficient to establish a generalisation similar to those for /r/ and /v/. A deeper investigation would perhaps shed more light on the matter and clarify the status of /g/.

6.4 Syllabic Canonical Form and Sequential Constraints

A syllable in Rutés can take any one of 12 shapes which we schematise as:

(C)(C)(C)V(C)(C)

That is, a syllable may start with a cluster of one, two, three, or no consonants and may end with a cluster of one, two, or none, the

only obligatory segment being the vowel.

Sequential possibilities:

V is any vowel

-in $(C_1)V(C_2)$ sequences (the subscripts are for identificational purposes), C_1 is any C except /ñ/ or /ʌ/, and C_2 is any C except /g/.

-in C_1C_2Vsequences a) if C_1 is /p,t,k,f or v/ C_2 is /r/

b) if C_1 is /s/ C_2 is /p,t, or k/

c) if C_1 is /m/ C_2 is /f/
/n/ /s or k/

-in $C_1C_2C_3V$sequences C_1 is /s/, C_2 is /p,t or k/ and C_3 is /r/

-in ...VC₁C₂ sequences the following combinations occur:

a) C_1 /s/ C_2 /p or t/

/ʃ/ /k/

b) C_1 /r/ C_2 /r (→[d]),m,n,l,p,t or k/

c) C_1 /m/ C_2 /v/(→[b]) or /m/

/n/ /r/(→[d]) or /n/

/n/ →[ŋ] /k/

The most common syllable type appearing in our data is CVC.

Note: We did find one example of \$VCCC\$ in the word *maéstr* 'teacher'

but this is suspect as native since all other Rutes words reduce the

Latin cluster 'str' to 'st' when word final, e.g., Lat. *nōstra* > *nōst*,

Lat. *fenéstra* > *fənɛst* (Sect. 2.2.2 above). Neapolitano also shows cluster reduction and has *maéste*.

In the corpus examined, the maximum medial consonant cluster observed

(that is across syllable boundary clusters) was CC.

Words reached a maximum of 4 syllables in length - we had two examples

of this maximum *kàraunár* 'coalman' and *lågənatúr* 'rolling-pin' - although

the most common word length is monosyllabic.

The maximum vowel sequence observed was XV-VY, where X and Y

represent any or no C segments. The sequence was not very common and the following combinations were noted:

a + é (2), á + i (2), a + ^(˘)ú (2), i + ə (2)

i + á (1), u + ə (1)

The parenthetical numbers refer to the number of instances of each.

6.5 Word Stress (see Appendix for illustrative examples)

Stress is phonologically significant in Rutés as its placement is not predictable. We make this observation without reservation for di- and tri-syllabic words and extrapolate to four syllable words because, as indicated above, our corpus only contains two four syllable words. The most common stress pattern for trisyllabic words is oxytonic. In our citation forms we mark (primary) stress with an acute accent on the stressed vowel, only on polysyllabic words containing two or more stressable vowels (see Table XI). It will be remembered that /ə/ cannot carry stress.

We have observed secondary stress only in compound words such as those referring to the days of the week still containing the reflex of the Latin word diēs 'day' and the two four-syllable words, which are also compounds. We have marked this secondary stress with a grave accent.

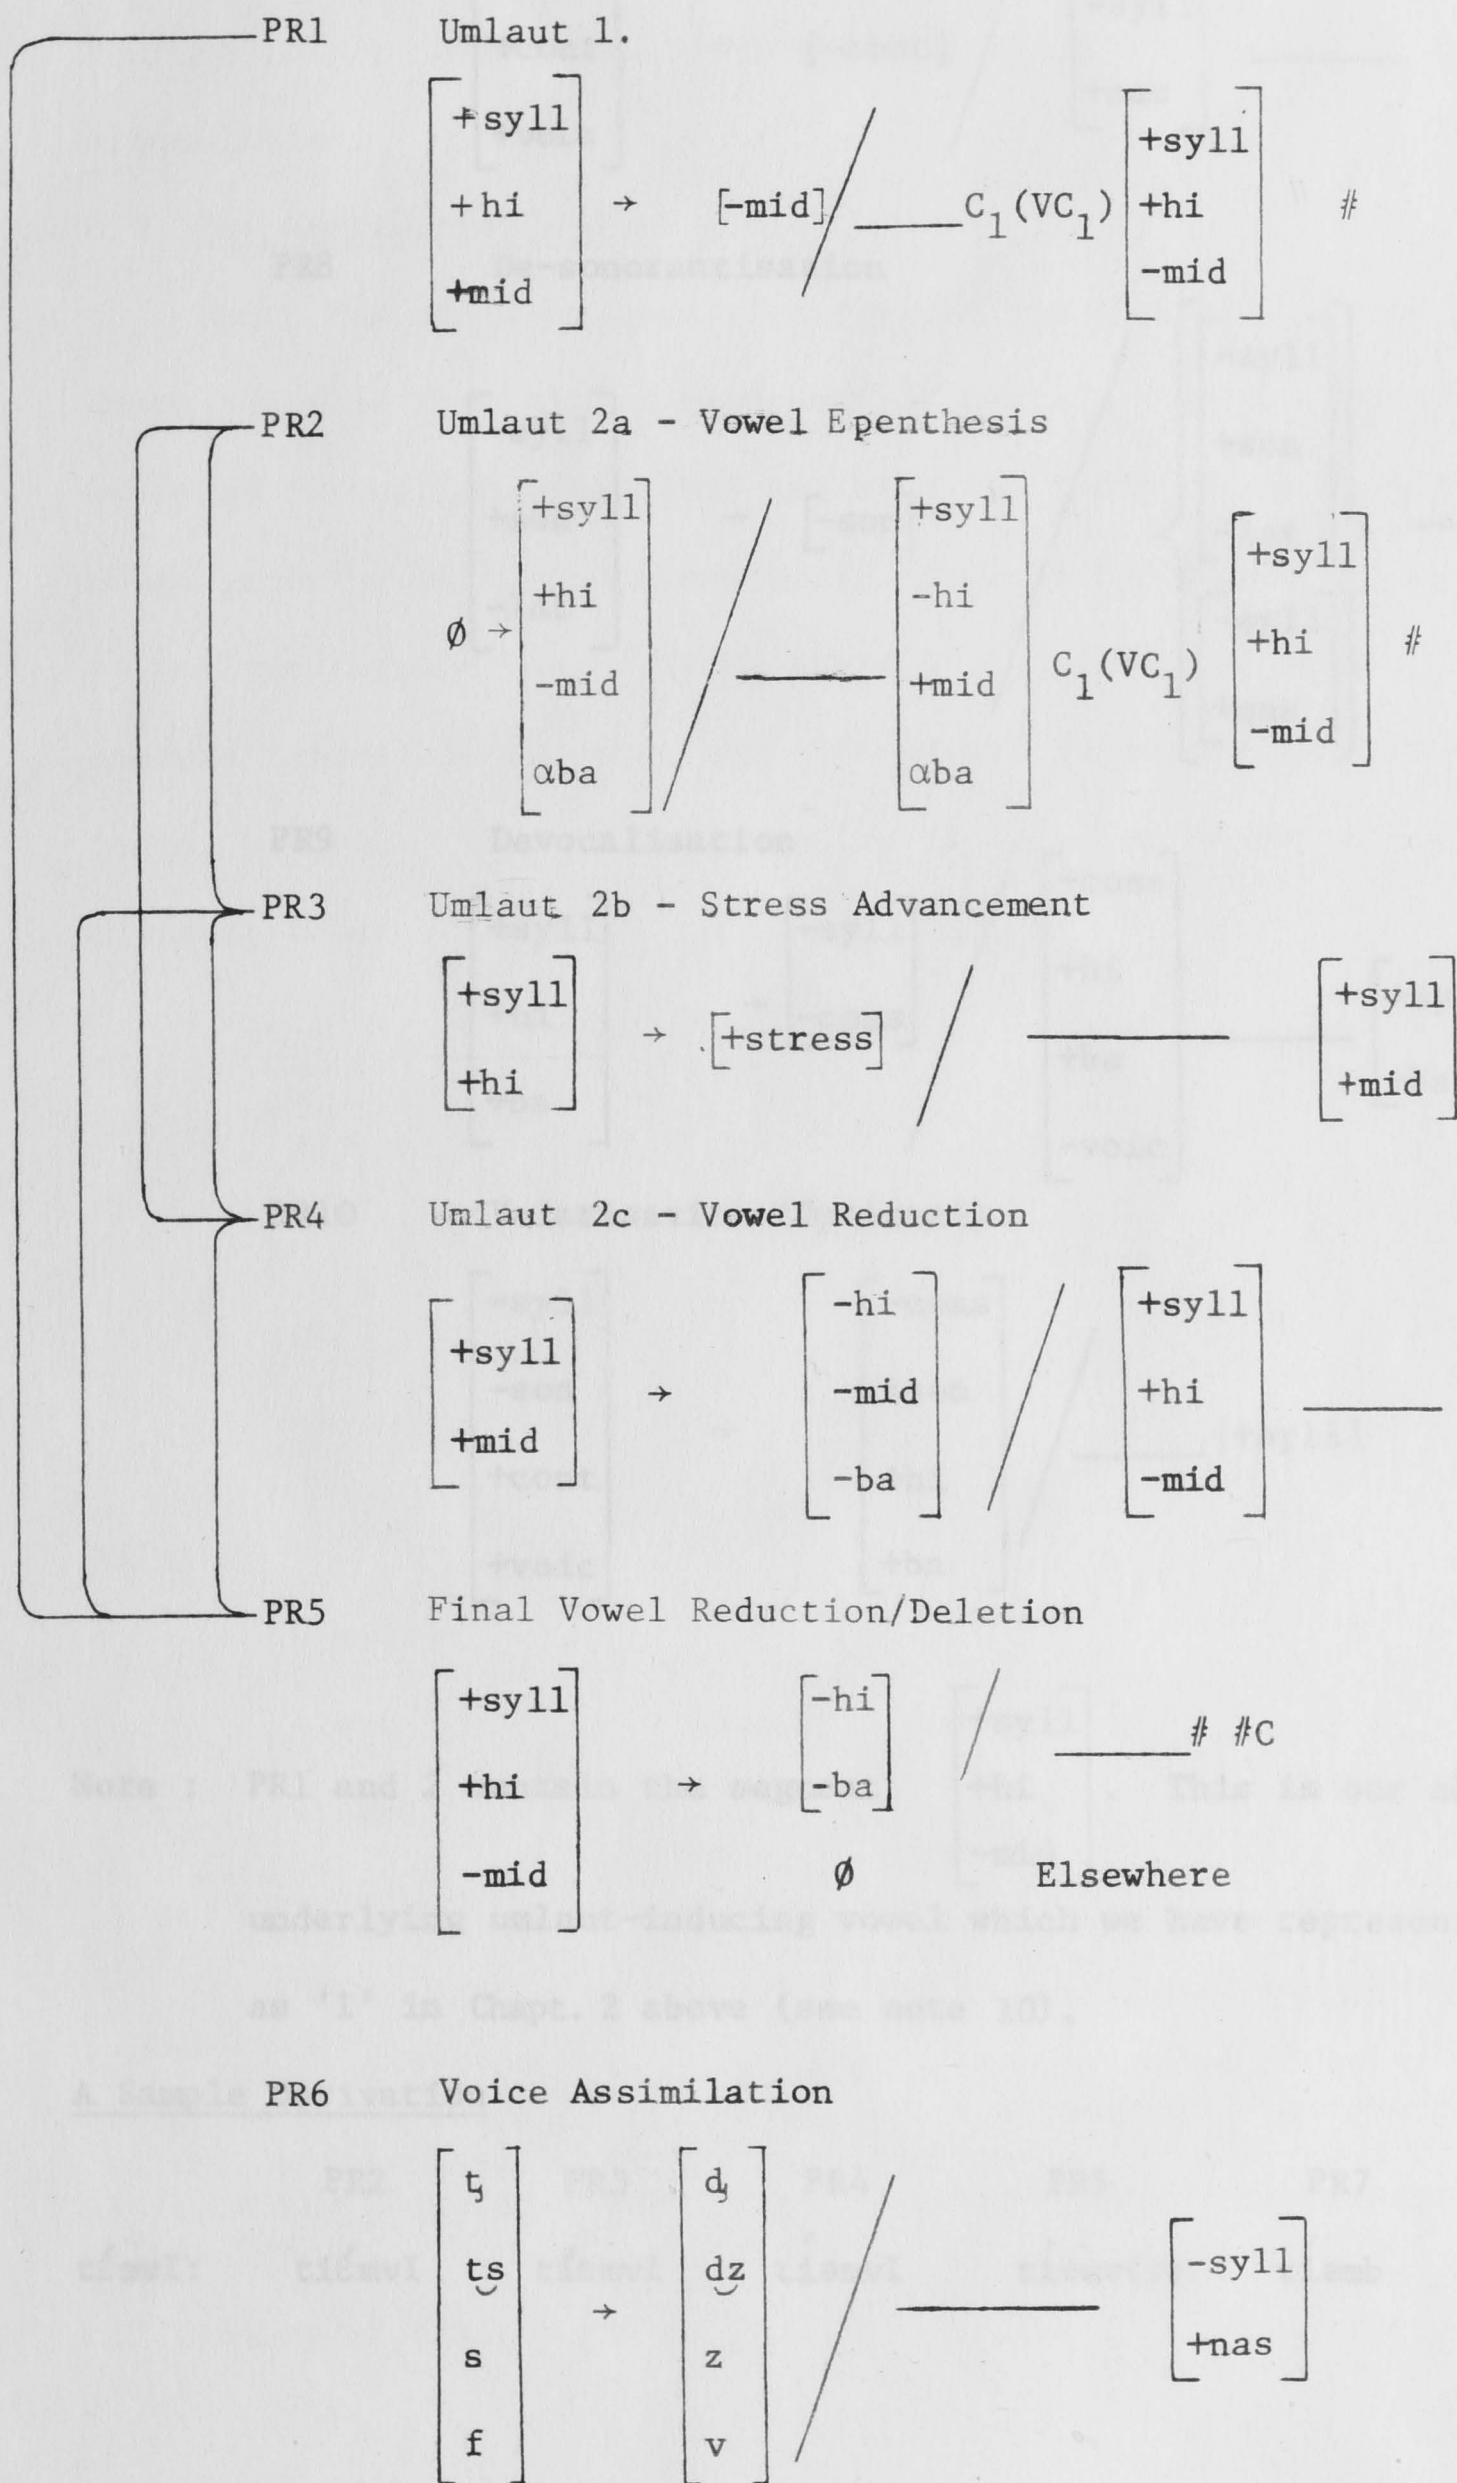

6.6 Distinctive Feature Matrices of Rutés Phonemes

In Table XII we have attempted to analyse the Rutés phonemes in generative phonological terms.

We have here included the phoneme /g/ although our discussion above (pp. 58-9) would perhaps suggest its omission, especially as we are unable, due to paucity of data, to integrate its (potential) alternations in our rules below. Thus we have enclosed it with a broken lined box in Table XII.

	p	t	ts	c	tj	k	ʃ	g	f	v	s	ʃ	j	r	l	λ	m	n	ñ	i	e	ε	a	ɔ	o	u	ə

Table XII - RUTÉS DF MATRICES

6.7 Some Phonological Rules

PR7 De-spirantisation

PR8 De-sonorantisation

PR9 Devocalisation

PR10 Velarisation (Optional)

Note : PR1 and 2 contain the segment

$$\begin{bmatrix} +\text{syll} \\ +\text{hi} \\ -\text{mid} \end{bmatrix}$$

underlying umlaut-inducing vowel which we have represented

as 'I' in Chapt. 2 above (see note 10).

A Sample Derivation

	PR2	PR3	PR4	PR5	PR7	
témvI:	tiémvI	tíémvI	tiəmvl	tíəmvl(ə)	tiəmb	'time'

We note that PR10, an optional rule, may in some way help to explain the 'jump' from [ɣ] to [v]. It is obvious that [w] provides the feature and/or phonetic link between labial and velar points of articulation.

6.8 Two Morphophonological Rules⁴²

Under PR7 and 8 we have also covered the phonetic change that takes place in the initial consonant of certain Feminine plurals (we avoid saying Feminine nouns as there are those which we have called mixed gender - sect. 4.4 above). It would be convenient to be able to include these nouns as being subject to the said P rules. It appears impossible to state the environment in purely phonological terms, however. The only alternative is to refer to morphological classes, thus:

MR 1

MR 2

42. Anderson (1974) discusses three different types of rules which he says are to be found in the phonology of a language - morpholexical rules, phonological rules and phonetic rules (p. xiv). Our P rules include the last two types and we feel our M rules are perhaps of his first type.

43. Those of Table X above.
