. .	Technical note	21

period of unemployment depend on a detailed set of questions. The items duration of looking for work and number of periods of looking for work during the previous twelve months are based on a more limited set of questions. It is for this reason that the term looking for work is used for these items rather than the more rigidly defined term unemployed.

Reliability of the estimates

13. Estimates in this publication are subject to two sources of error:

- (a) *sampling error*: since the estimates are based on information obtained from occupants of a sample of dwellings, they may differ from the figures that would have been produced if all dwellings had been included in the survey. More information on this topic is given in the Technical note.
- (b) *non-sampling error*: inaccuracies may occur because of imperfections in reporting by interviewers and respondents and errors made in the coding and processing of data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Related publications

Australian Statistician

SUMMARY OF FINDINGS

During the period July 1982 to July 1983, the number of persons looking for work increased by 52.8 per cent, from 439,300 persons to 671,200. Compared with July 1982, in July 1983 larger proportions of persons looking for work were registered with the CES, reported 'no vacancies at all' as their main difficulty in finding work, had been retrenched from their last job and had one period of looking for work during the previous twelve months. The proportion of persons whose duration of last job was more than one year also increased.

In both July 1982 and July 1983, 'no vacancies at all' was the most commonly reported main difficulty in finding a job. The proportion of persons who reported this main difficulty increased from 26.9 per cent in July 1982 to 33.1 per cent in July 1983. An increase was recorded for both males and females, and in July 1983 the proportion of males (36.2 per cent) who reported this reason as the main difficulty was higher than for females (27.9 per cent). The proportion of persons reporting the main reason 'no vacancies in line of work' also increased, from 16.3 per cent in July 1982 to 18.5 per cent in July 1983.

DIAGRAM 1. PERSONS LOOKING FOR WORK—MAIN DIFFICULTY FINDING WORK
(Source of data: Table 5 of 1982 publication and table 11 of this publication)

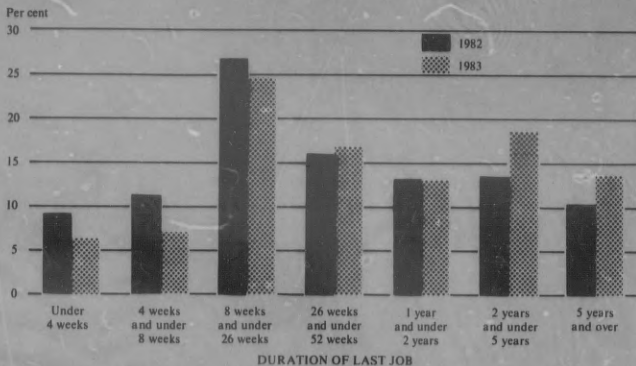

402,700 persons looking for work had been wage or salary earners in their last full-time job and had finished working in that job in the two years ending July 1983. Of these, 227,500 (56.5 per cent) had been retrenched or lost their previous job, 45,100 (11.2 per cent) had been doing temporary or seasonal work and 38,000 (9.4 per cent) had left their job because of unsatisfactory work arrangements. By comparison with July 1982, a larger proportion of persons had been retrenched or lost their previous job and a smaller proportion had left because of unsatisfactory work arrangements.

DIAGRAM 2. PERSONS LOOKING FOR WORK WHO WERE WAGE OR SALARY EARNERS IN THEIR LAST FULL-TIME JOB AND WHO FINISHED WORKING IN THAT JOB DURING THE TWO YEARS PRIOR TO THE SURVEY—REASON LEFT LAST JOB
(Source of data: Table 4)

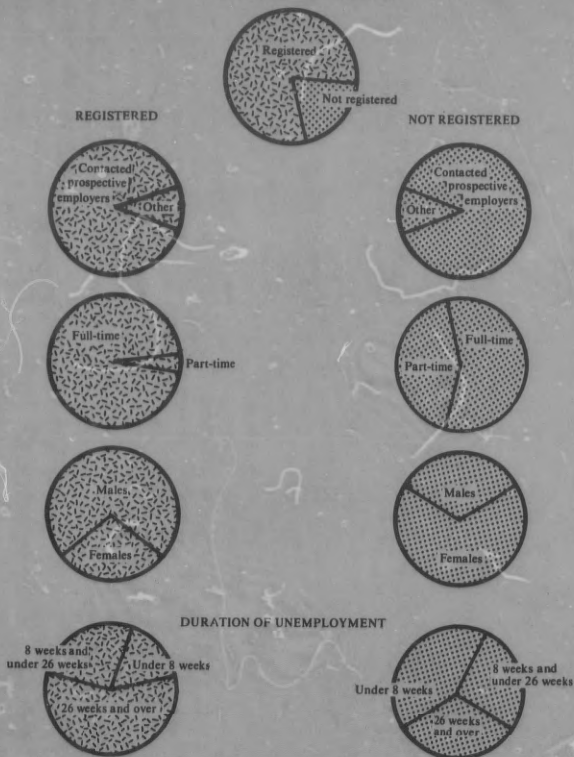

The proportions of persons who had been in their previous job for two and under five years and for five years and over rose from 13.5 to 18.5 per cent and from 10.4 to 13.7 per cent respectively. Conversely, the proportion of persons who had been in their previous job for less than one year fell from 63.0 to 54.7 per cent. In particular, the proportion of persons who had been in their previous job for four and under eight weeks was significantly lower in 1983 compared with 1982 (7.0 and 11.3 per cent respectively).

DIAGRAM 3. PERSONS LOOKING FOR WORK WHO WERE WAGE OR SALARY EARNERS IN THEIR LAST FULL-TIME JOB AND WHO FINISHED WORKING IN THAT JOB DURING THE TWO YEARS PRIOR TO THE SURVEY—DURATION OF LAST JOB
(Source of data: Table 23)

In July 1983, 80.2 per cent of persons looking for work were registered with the CES, compared with 72.7 per cent in July 1982. Females were predominant amongst those jobseekers not registered with the CES and only 63.9 per cent were registered compared with 89.6 per cent for males. The proportion of persons looking for work who wanted full-time work (88.1 per cent) did not change significantly over the period July 1982 to July 1983. This was the case whether or not persons were registered with the CES. Of all persons registered with the CES a majority were looking for full-time work.

DIAGRAM 4. COMPARATIVE PROFILE OF PERSONS LOOKING FOR WORK—REGISTERED AND NOT REGISTERED WITH THE CES
(Source of data: Tables 15 and 16)

In July 1983, 173,500 (25.9 per cent) persons looking for work had post-school qualifications, while 497,700 (74.1 per cent) did not. This proportion of persons looking for work who had post-school qualifications is lower than the proportion (32.9 per cent) of the civilian population aged 15 years or more who had post-school qualifications, as measured in February 1983.

In addition, a smaller proportion (46.5 per cent) of persons with post-school qualifications who were looking for work had a current period of unemployment of 26 weeks and over, than of persons without post-school qualifications (54.4 per cent).

DIAGRAM 5. PERSONS LOOKING FOR WORK—EDUCATIONAL ATTAINMENT AND DURATION OF CURRENT PERIOD OF UNEMPLOYMENT

(a) Lasting two weeks or more. (b) Excludes a small number of persons working for payment in kind. (c) Before tax or anything else was taken out.

TECHNICAL NOTE

Estimation procedure

The estimates are derived from the population survey by use of a ratio estimation procedure which ensures that the estimates conform to an independently estimated distribution of the population for each capital city and remainder of State by age and sex, rather than to the corresponding distribution within the sample itself.

Reliability of the estimates

2. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they are subject to sampling variability, that is, they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of the likely difference is the *relative standard error*, which is obtained by expressing the standard error as a percentage of the estimate.

3. Space does not allow for the separate indication of the standard errors of all estimates in this publication. A table of standard errors for general application is given on the following page. Since they are averages based on calculations for a limited number of past surveys over a wide range of labour force characteristics these figures will not give a precise measure of the standard error of a particular estimate but they will provide an indication of its magnitude.

4. An example of the calculation and the use of standard errors in relation to estimates of persons is as follows. Table 5 on page 10 shows the estimated number of persons in Australia who have been looking for work for one year or longer is 176,500. Since this estimate is between 100,000 and 200,000, the standard error for Australia will be between 3,900 and 5,100 in the standard error table and can be approximated as 4,800 (rounded to the nearest 100). Therefore, there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall in the range 171,700 to 181,300 and about nineteen chances in twenty that the value will fall within the range 166,900 to 186,100. This example is illustrated in the following diagram.

5. As can be seen from the standard error table, the smaller the estimate the higher is the relative standard error. Very small estimates are thus subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this publication, estimates less than the lowest levels shown in the standard error table have not been published. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

6. Proportions and percentages formed from the ratio of two estimates are also subject to sampling errors. The size of the error depends on the accuracy of both the numerator and the denominator. The formula for the relative standard error (RSE) of a proportion is given below:

$$RSE(x/y) = \sqrt{[RSE(x)]^2 + [RSE(y)]^2}$$

7. Considering the example from paragraph 4 above, the 176,500 persons represent 26.3 per cent of the 671,200 persons who are looking for work. The standard error of 671,200 is approximately 7,850 so the relative standard error is 1.2 per cent. The relative standard error for 176,500 is 2.7 per cent. Applying the above formula, the relative standard error of the proportion is $\sqrt{(2.7)^2 + (1.2)^2}$ or 2.4 per cent, giving a standard error for the proportion (26.3 per cent) of 0.6 percentage points. Therefore, there are about two chances in three that the proportion of persons looking for work who had been doing so for one year or longer is between 25.7 per cent and 26.9 per cent and nineteen chances in twenty the proportion is within the range 25.1 per cent to 27.5 per cent.

8. Published figures may also be used to estimate the difference between two survey estimates (of numbers or percentages). Such a figure is itself an estimate and is therefore subject to sampling error. The sampling error of the difference between two estimates depends on their standard errors and the relationship (correlation) between them. An approximate standard error (SE) of the difference between two estimates (x-y) may be calculated by the following formula:

$$SE(x-y) = \sqrt{[SE(x)]^2 + [SE(y)]^2}$$

While this formula will only be exact for differences between separate and uncorrelated characteristics or sub-populations it is expected to provide a good approximation for all differences likely to be of interest in this publication.

9. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents and errors made in the coding and processing of data. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or a sample.

STANDARD ERRORS OF ESTIMATES

Size of sample	S.E.W.	S _e	Q _e	I.A.	W.A.	S _e	S.T.	A.C.T.	Accuracy	
									Relative standard error	(per cent)
1,000						250				
1,500						300		300		
2,000						350		400		
2,500			6.50	5.10	500	300	550	400		
3,000			6.00	5.00	500	400	550	510	800	26.7
3,500	925	910	7.00	5.00	600	450	700	520	800	24.0
4,000	900	900	7.00	6.25	600	400	620	500	920	23.0
4,500	1,000	1,000	8.50	6.50	700	400	650	550	970	21.8
5,000	1,100	1,100	9.00	6.50	750	500	680	640	1,000	20.0
6,000	1,200	1,200	9.00	7.50	750	550	700	650	1,100	18.0
10,000	1,500	1,400	1,200	9.00	7.50	600	650	650	1,400	16.0
20,000	2,000	1,800	1,500	1,500	1,500	600	1,200	950	2,000	10.0
50,000	2,500	2,700	2,200	1,600	1,700	1,000	1,700	1,100	2,500	9.0
100,000	3,000	3,500	2,600	2,100	2,200	1,500	2,000	1,500	3,000	9.0
200,000	3,000	4,000	3,000	2,000	2,700	1,500	2,500	1,500	3,500	9.0
500,000	3,000	3,000	4,100	2,000	3,000				4,000	9.0
700,000	4,000	3,000	4,000	3,500	3,500				7,200	18.0
1,000,000	5,500	3,000	5,000						8,100	18.0
2,000,000	10,000	6,500							11,000	11.0
5,000,000									15,000	10.0
