## NOTES ON THE ESTIMATES

## MAIN FEATURES

*NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.*

## ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage points Contribution to Growth in GDP	
	Dec. qtr 1982 to Mar. qtr 1983	Mar. qtr 1982 to Mar. qtr 1983	Dec. qtr 1982 to Mar. qtr 1983	Mar. qtr 1982 to Mar. qtr 1983
	Final consumption expenditure—			
Private	0.9	1.8	0.6	1.1
Government	3.7	12.1	0.6	1.9
Gross fixed capital expenditure	-4.3	-10.6	-1.0	-2.6
Increase in stocks	..	..	-0.7	-3.8

Gross non-farm product	-0.8	-0.8	-0.7	-0.8

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements fell by 0.2 per cent in March quarter 1983, following a rise of 0.2 per cent in the previous quarter, while gross operating surplus of trading enterprise companies fell by 5.7 per cent after rising by 7.9 per cent in the December quarter 1982.

The following notes are provided to aid analysis of the estimates for recent quarters.

**Gross operating surplus-companies**

The gross operating surplus of companies is obtained by deducting the stock valuation adjustment (SVA) from an estimate of the profits of companies which, for the quarters of the latest year, are calculated using data obtained from the profits survey conducted by the ABS. During the past few quarters there have been some particularly erratic movements in the estimates of gross operating surplus of companies, caused by volatility in the SVA and the profits survey results. (The March and June quarter 1982 issues of this publication have contained details concerning the assumptions used in estimating the SVA and the way in which the SVA can be subject to quite large quarterly fluctuations.)

**Gross final consumption expenditure**

The current price value of this aggregate is estimated using data from public authority accounts, which record cash flows. The estimates therefore reflect the effects of

pre-payment of salaries over holiday periods, back pay associated with award changes, etc. It is not always possible to identify all these effects when compiling the deflators used to derive constant price estimates. Therefore, quarter-to-quarter movements in the constant price seasonally adjusted estimates for this aggregate should be treated with caution. The March quarter 1983 estimate is also affected significantly by the inclusion of the full value (\$174 million in current prices) of a frigate delivered to the Australian Navy in January 1983.

**Gross farm product**

In the seasonal adjustment of gross farm product the output of commodities not produced in every quarter of the year (such as wheat) is spread evenly across the four quarters of the financial year. Forecasts of annual output are generally used in these cases to obtain seasonally adjusted estimates for the latest year. (See also paragraph 10 of the Explanatory notes.) The low harvest of wheat

and other grain crops in 1982-83 is reflected in the seasonally adjusted change in gross farm product in the September quarter 1982. The fall of 13.6 per cent between September and December quarters 1982 is due partially to large falls in livestock slaughtering and the output of some non-grain crops, following unusually high levels in the September quarter. In addition, inputs (especially fodder) have increased as output has declined in those quarters, thereby exacerbating the decline in the seasonally adjusted constant price gross product of the farm sector in December quarter 1982. There was little change between December quarter 1982 and March quarter 1983 in any of the component series (in seasonally adjusted constant price terms).

#### Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters.

#### PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

Quarters ended	Income based(a)	Expenditure based(b)
1981— December	-0.6	0.1
1982— March	-0.2	-1.0
June	0.2	-0.5
September	0.5	1.1
December	-0.7	0.1
1983— March	-0.8	0.7

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

#### Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the March quarter was 86.6 per cent while household saving which is derived as a balancing item represented 13.4 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

Quarters ended	Percentage
1981— December	12.7
1982— March	11.7
June	12.4
September	12.6
December	13.0
1983— March	13.4

#### Implicit price deflators

In March quarter 1983 the implicit price deflator (IPD) for imports of goods and services rose by only 0.3 per cent. This very small increase is largely due to the impact on the average prices of fuel imports of the OPEC price cuts in February 1983. The effect of the 10 per cent devaluation of the Australian dollar on 8 March 1983 is expected to be reflected in the imports IPD in June quarter 1983.

The IPDs for gross domestic product (GDP), gross non-farm product (GNFP) and gross national expenditure (GNE) have increased only marginally during March quarter 1983 following fairly strong rises in December quarter 1982. However, it is possible that the December quarter IPDs overstate and the March quarter IPDs understate actual price movements in these components. The reason for this is explained briefly below.

The quarterly IPDs shown in this publication are derived by dividing a seasonally adjusted current price value by the corresponding seasonally adjusted constant price value. The seasonal adjustment of current price GNFP is carried out by adjusting a number of income components and aggregating them, whereas in constant price terms GNFP is seasonally adjusted in total. As a result, it is possible for different seasonal patterns to be estimated for the current and constant price seasonally adjusted series and these will show up in the IPD. Since seasonally adjusted constant price estimates of GDP and GNE are dependent on seasonally adjusted GNFP any differences which may be in GNFP will also be carried through into these other two aggregates.

#### Revisions

The incorporation of more complete survey data has resulted in significant revisions to a number of the components on the expenditure side of the domestic production account in December quarter 1982.

## EXPLANATORY NOTES

## Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the March quarter 1983, together with comparative estimates for the eight previous quarters and the four years 1978-79 to 1981-82. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the March quarter 1983, together with comparative estimates for the twelve previous quarters. Tables 32-42 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

## Concepts, definitions, sources and methods

2. A basic guide to the Australian national accounts entitled *Australian National Accounts, Concepts, Sources and Methods* (5216.0) was released early in 1982. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the estimates contained in this publication are as described in 5216.0 but with the changes outlined in Appendix A, *Australian National Accounts, National Income and Expenditure, 1981-82* (5204.0) which will be released later this year.

## Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

5. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$30 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully

consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

#### Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1982* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

#### Analysis of contributions to growth table

12. Table 3 represents an analysis of the contribution provided by each major aggregate to the percentage

change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP(t-1) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

#### Rounding of figures

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

15. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

#### Related publications

16. In addition to those mentioned above other ABS publications which may be of interest include:

*Historical Series of Quarterly Estimates of National Income and Expenditure, Australia, (5207.0)*—issued for December Quarter only

*Australian National Accounts, Gross Product by Industry, 1980-81* (5211.0)

Budget Paper: *National Income and Expenditure, 1981-82* (5213.0)

17. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
