Title taken from original documentation.

Summary: This survey, the latest in a ten year series of data collection on the drug use of children of school age in New South Wales, was conducted to provide comparable longitudinal data on a number of aspects of adolescent drug use. The aim of the survey series was to present objective evidence on patterns of secondary school children's drug use and to provide an analysis of trends in drug taking since 1971. Information was collected on the use of eight drugs: alcohol, tobacco, analgesics, sedative/hypnotics, cannabis, hallucinogens, narcotics and stimulants. Respondents were questioned on their use, age at first use, source and setting of use, frequency of use in past four weeks and past week and the usual quantity consumed. Background variables included age, sex, year level, living arrangements, parents occupations, leisure activities, income and source of income.

ACKNOWLEDGEMENT OF ASSISTANCE

All manuscripts based in whole or in part on these data should:

- (i) identify the data and original investigators by including the bibliographic reference for the data file given on the reverse of the title page;
- (ii) acknowledge the Social Science Data Archives and, where the data are made available through the Social Science Data Archives by another archive, acknowledge that archive;
- (iii) declare that those who carried out the original analysis and collection of the data bear no responsibility for the further analysis or interpretation of them.

In order to assemble essential information about the use of archival resources and to facilitate the exchange of information about users' research activities, individuals are requested to deposit two copies of each completed manuscript, thesis abstract, or reprint to the Social Science Data Archives.

ANALYSIS CONDITIONS

RESEARCH TOPIC (ABSTRACT)

This survey, the latest in a ten year series of data collection on the drug use of children of school age in New South Wales, was conducted to provide comparable longitudinal data on a number of aspects of adolescent drug use. The aim of the survey series was to present objective evidence on patterns of secondary school children's drug use and to provide an analysis of trends in drug taking since 1971.

Information was collected on the use of eight drugs: alcohol, tobacco, analgesics, sedative/hypnotics, cannabis, hallucinogens, narcotics and stimulants. Respondents were questioned on their use, age at first use, source and setting of use, frequency of use in past four weeks and past week and the usual quantity consumed. Background variables included age, sex, year level, living arrangements, parents occupations, leisure activities, income and source of income.

KIND OF DATA

survey

TIME DIMENSIONS

trend study

In most cases, the survey was conducted on the same population in 1974, 1977 and 1980. Different questionnaires were used each year.

DEFINITION OF TOTAL UNIVERSE (UNIVERSE SAMPLED)

students attending both Government and Independent secondary schools in New South Wales

SAMPLING PROCEDURES

stratified random sample

A representative selection of 31 secondary schools, both Government and Independent, was chosen from across the state. Each school was asked to provide a random sample of 10% of their total enrolment of pupils in Years 7 to 12.

NUMBER OF UNITS (CASES)

number of cases (unweighted): 2205

The 31 schools which had taken part in the 1977 survey were again selected for surveying in 1980. Three of these were not available: one had changed its status, the second had examination commitments and the headmaster of the third expressed reluctance. Replacement schools of similar size and composition were selected. 2217 completed questionnaires were received. 12 were discarded because of incompleteness or suspect validity.

DATES OF DATA COLLECTION

first date of data collection: September 1980

last date of data collection: October 1980

METHOD OF DATA COLLECTION

self-completion (group setting)

The students completed the questionnaires under supervision during class time.

ACTIONS TO MINIMISE LOSSES

Anonymity and confidentiality of individual responses were assured.

OTHER ANALYSIS CONDITIONS

The raw data file contains 2,205 cases. In 66 of these, sex and/or age were not reported. These were excluded from further analysis by the principal investigators.

The wording of the questionnaire conformed with the suggestions for standardised survey format developed by Drew et al. (Department of Health: Technical Information Bulletin Supplement No. 4. No. 66. April 1981).

Data from previous surveys are not extant.

DIMENSIONS OF DATA SET

number of cases: 2205

number of variables per case: 108

number of cards per case: 2

ACCESSIBILITY

A copy of the User Undertaking Form must be signed before data may be accessed.

SCHOOLS SURVEY.

This booklet contains questions of different kinds about people and drugs. Its purpose is to learn what people think about the use of drugs.

This is not a test. There are no right or wrong answers, but we do ask that you try to answer each question as truthfully as you can without boasting. If you don't know the answer to a question or if you feel that you can't answer it truthfully, then miss that question out and go on to the next one. However, we would like you to answer every question if you can.

Remember that we do not know who you are and that your comments are PRIVATE and CONFIDENTIAL.

For most of the questions there is a choice of answers and you pick the one that's true for you. Put a tick in the brackets next to it.

1. What year level (or form) are you in? (tick one)

- | | | | |
|----|------------------|---|---|
| 1. | Year 7 (Form 1) | (|) |
| 2. | Year 8 (Form 2) | (|) |
