NOTES ON THE ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage Points Contribution to Growth in GDP	
	Sept. qtr 1983 to Dec. qtr 1983	Dec. qtr 1982 to Dec. qtr 1983	Sept. qtr 1983 to Dec. qtr 1983	Dec. qtr 1982 to Dec. qtr 1983
Final consumption expenditure—				
Private	1.1	1.7	0.7	1.1
Government	-3.0	3.5	-0.5	0.6
Gross fixed capital expenditure	-0.7	-8.6	-0.1	-2.0
Increase in stocks	..	..	0.4	2.8
Statistical discrepancy	..	..	1.1	2.9

Gross non-farm product	2.2	4.6	2.1	4.4

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 5.6 per cent in December quarter 1983, following a rise of 0.9 per cent in the previous quarter, while gross operating surplus of trading enterprise companies rose by 4.8 per cent after rising strongly by 12.4 per cent in the September quarter 1983.

The following notes are provided to aid analysis of the estimates for recent quarters.

Wages, salaries and supplements

The seasonally adjusted movements in this aggregate for recent quarters should be interpreted cautiously in the light of the following discussion.

Until September quarter 1981 estimates of wages, salaries and supplements were mainly based on payroll tax data. From December quarter 1981 the estimates have been based on sample surveys of employers. A small interim survey was introduced from December quarter 1981 until a full-scale Survey of Employment and Earnings (SEE) could be established. That survey (SEE) has operated since September quarter 1983 and has been taken into account in the earnings estimates in this publication. The employment coverage of both sets of survey estimates has been adjusted to reflect movements in the number of wage and salary earners shown in the monthly Labour Force Survey.

As estimates from both the interim survey and SEE are based on information obtained from samples of employers, they are subject to sampling variability; that is, they may differ from the figures that would have been produced if data had been collected from all employers.

A small survey of pay periodicity was conducted in respect of September quarter 1981 in order to assist in estimating the effects of changes in the seasonal pattern between the payroll tax data underlying the series prior to December quarter 1981 and the interim survey data underlying the series from December quarter 1981. Because of the limited nature of the data that was obtained in that survey, extra caution is required in interpreting the seasonally adjusted estimates since December quarter 1981. These seasonally adjusted estimates may be revised in the light of more comprehensive data

which is planned to be collected in a pay periodicity survey is to be conducted in respect of September quarter 1984.

Gross farm product

The large increase of 39 per cent in seasonally adjusted farm product at constant prices in September quarter 1983 is the consequence of two major factors. First, and most significantly, the impact of the record wheat and other grain harvests in 1983-84 shows up in seasonally adjusted terms in the September quarter. (See paragraph 10 of the Explanatory notes for an explanation of the methods used to seasonally adjust the production series for these commodities.) Second, the increase in production of wool in September quarter 1983 was unusually large because of the impact of a shearers' strike in New South Wales on production in the preceding quarter.

Government final consumption expenditure

The implicit price deflator of this aggregate rose by 3.9 per cent in the December quarter 1983. The main reason for the relatively large rise is the national wage case decision which increased wages by 4.3 per cent with effect from early October 1983.

Stocks

In seasonally adjusted terms, private non-farm stocks at constant prices declined markedly for the fifth successive quarter. With the large run-downs in stocks that have occurred since September quarter 1982, the constant price private non-farm stocks to sales(a) ratio is now at the lowest level ever recorded in the quarterly national accounts. The private non-farm stocks to sales ratio in recent quarters is as follows:

Quarters ended	Ratio
1982—	
September	0.777
December	0.771
1983—	
March	0.760
June	0.738
September	0.706
December	0.674

(a) Constant price sales are defined as gross non-farm product plus imports of goods and services (excluding petroleum, civil aircraft and government imports) less changes in private non-farm stocks. (All these variables are at average 1979-80 prices.)

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals

are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters.

PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

Quarters ended	Income-based(a)	Expenditure-based(b)
1982—		
September	0.4	0.3
December	-0.8	-0.7
1983—		
March	0.1	0.5
June	-1.0	-2.5
September	3.2	2.6
December	2.2	1.1

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

The rise in the statistical discrepancy in the last three quarters, which is reflected in the difference between the figures in this table, means that the income-based estimates are indicating a stronger recovery than the expenditure-based estimates.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the December quarter was 85.5 per cent while household saving which is derived as a balancing item represented 14.5 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

Quarters ended	Percentage
1982—	
September	11.6
December	12.9
1983—	
March	13.3
June	12.7
September	13.9
December	14.5

Revisions

All estimates have been revised since the September quarter 1983 issue of this publication. Revised annual estimates will be published shortly in *Australian National Accounts, National Income and Expenditure, 1982-83 (Advance Release)* (5201.0). Seasonally adjusted estimates have also been revised following the normal annual reanalysis of all adjusted series. The private non-farm

stock valuation adjustment (SVA), which is deducted from increase in book value of private non-farm stocks to derive the aggregate increase in private non-farm stocks, has been seasonally adjusted for the first time because a stable seasonal pattern has been identified for recent years. (The SVA is also deducted from the income side of the domestic production account to derive gross operating surplus of trading enterprises).

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the December quarter 1983, together with comparative estimates for the eight previous quarters and the four years 1979-80 to 1982-83. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the December quarter 1983, together with comparative estimates for the twelve previous quarters. Tables 32-42 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

Concepts, definitions, sources and methods

2. A basic guide to the Australian national accounts entitled *Australian National Accounts, Concepts, Sources and Methods* (5216.0) is available. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the estimates contained in this publication are as described in 5216.0 but with the changes outlined in Appendix A, *Australian National Accounts, National Income and Expenditure, 1981-82* (5204.0).

Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

5. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the sensitivity of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$30 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully

consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

12. Table 3 represents an analysis of the contribution provided by each major aggregate to the percentage

change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP(t-1) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

15. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

Related publications

16. In addition to those mentioned above other ABS publications which may be of interest include:

Historical Series of Quarterly Estimates of National Income and Expenditure, Australia, (5207.0)—issued for December Quarter only

Australian National Accounts, Gross Product by Industry, 1981-82 (5211.0)

Budget Paper: *National Income and Expenditure, 1982-83 (5213.0)*

17. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
