INQUIRIES

- *for further information about these statistics and the availability of related unpublished statistics*, contact Mike Lawson on Brisbane (07) 222 6286.
- *for information about other ABS statistics and services* please contact Information Services on Brisbane (07) 222 6351 or any ABS State office.

MAIN FEATURES

Dwelling units commenced

- In seasonally adjusted terms, the number of dwelling units commenced in June quarter 1991 (8,520) increased by 6 per cent over March quarter 1991 and increased by 7 per cent when compared with June quarter 1990. Private sector house commencements in June quarter 1991, in seasonally adjusted terms, were 6,400, an increase of 19 per cent over March quarter 1991 and an increase of 13 per cent when compared with June quarter 1990.

- In original terms, the number of dwelling units commenced in June quarter 1991 was 8,570. This figure was 22 per cent above the number commenced in March quarter 1991 and 8 per cent above the June quarter 1990.

Dwelling units completed

- The number of dwelling units completed in June quarter 1991, in seasonally adjusted terms, was 8,480, an increase of 12 per cent over the March quarter 1991 figure and marginally higher than that recorded for June quarter 1990. Private sector house completions in June quarter 1991 totalled 5,710, an increase of 5 per cent over March quarter 1991 and an increase of 4 per cent over June quarter 1990.

- In original terms, the number of dwelling units completed during June quarter 1991 was 7,950. This figure was 12 per cent above the number completed during March quarter 1991 and marginally higher than that recorded in June quarter 1990.

Non-residential building activity

- A comparison of statistics for non-residential building activity during June quarter 1991 with those for March quarter 1991, shows that the value of work commenced increased by 13 per cent, the value of work completed decreased by 22 per cent and the value of work under construction at the end of the period increased by 4 per cent.

Value of building work done

- The value of building work done in June quarter 1991, seasonally adjusted at constant prices, increased by 3 per cent over that for March quarter 1991.

The movements in the original and seasonally adjusted estimates of the value of building work done between March quarter 1991 and June quarter 1991 and between June quarter 1990 and June quarter 1991 are shown in the following table.

MOVEMENT IN VALUE OF BUILDING WORK DONE, QUEENSLAND
(per cent)

	March qtr 1991 to June qtr 1991			*June qtr 1990 to June qtr 1991*		
Particulars	*Original*	*Seasonally adjusted*	*Seasonally adjusted at average 1984-85 prices*	*Original*	*Seasonally adjusted*	*Seasonally adjusted at average 1984-85 prices*

EXPLANATORY NOTES

Introduction

The statistics in this publication were compiled on the basis of returns collected from builders and other individuals and organisations engaged in building activity. The quarterly survey consists of two components:

(a) a sample survey of private sector house building activity involving new house construction or alterations and additions valued at $10,000 or more to houses and

(b) a complete enumeration of jobs involving construction of new residential buildings other than private sector houses, all alterations and additions to residential buildings, other than private sector houses, with an approval value of $10,000 or more and all non-residential building jobs with an approval value of $50,000 or more.

2. From the September quarter 1990, only non-residential building jobs (both new and alterations and additions) with an approval value of $50,000 (previously $30,000) or more are included in the survey. The impact of these changes is relatively small at the all-Australia level, however, care should be taken in interpreting data for specific classes of non-residential building. The ABS will continue to periodically review the cut-offs for both residential and non-residential building activity to take account of inflation in future years.

3. The use of sample survey techniques in the building activity survey means that reliable estimates of private sector house building activity, including alterations and additions to houses, are available only at the State/ Territory and Australian levels. Further geographical disaggregations are not available. Dwelling unit commencement data for regions below State/Territory level, however, are shown in the series of dwelling unit commencements reported by approving authorities. Data from that series, unlike those compiled from the building activity survey, are based on information reported by local and other government authorities.

Scope and coverage

4. The statistics relate to building activity which includes construction of new buildings and alterations and additions to existing buildings. Construction activity not defined as building (e.g. construction of roads, bridges, railways, earthworks etc.) is excluded.

5. Building jobs included in each quarter in the building activity survey comprise those building jobs selected in previous quarters which have not been completed (or commenced) by the end of the previous quarter and those building jobs newly selected in the current quarter. The population list from which building jobs are selected for inclusion comprises all approved building jobs which were notified to the ABS up to but not including the last month of the reference quarter (i.e. up to the end of August in respect of the September quarter survey). This introduces a lag to the statistics in respect of those building jobs notified and commenced in the last month of the reference quarter (i.e. for the month of September in respect of the September quarter survey). For example, building jobs which were notified as approved in the month of June and which actually commenced in that month are shown as commencements in September quarter. Similarly, building jobs which were notified in the month of September and which actually commenced in that month are shown as commencements in December quarter.

Definitions

6. A *building* is defined as a rigid, fixed and permanent structure which has a roof. Its intended purpose is primarily to house people, plant, machinery, vehicles, goods or livestock. An integral feature of the design of a building, to satisfy its intended use, is the provision for regular access by persons.

7. A *dwelling unit* is defined as a self-contained suite of rooms, including cooking and bathing facilities, intended for long-term residential use. Units (whether self-contained or not) within buildings offering institutional care, such as hospitals, or temporary accommodation such as motels, hostels and hotels, are not defined as dwelling units. The value of units of this type is included in the appropriate category of 'non-residential building'.

8. A *residential building* is defined as a building predominantly consisting of one or more dwelling units. Residential buildings can be either 'houses' or 'other residential buildings'.

(a) A 'house' is defined as a detached building predominantly used for long-term residential purposes and consisting of only one dwelling unit. Thus, detached 'granny flats' and detached dwelling units (such as caretakers' residences) associated with 'non-residential buildings' are defined as houses for the purpose of these statistics.

(b) An 'other residential building' is defined as a building which is predominantly used for long-term residential purposes and which contains (or has attached to it) more than one dwelling unit (e.g. town houses, duplexes, apartment buildings etc.).

9. The number of dwelling units created by alterations and additions to existing buildings, and through the construction of new 'non-residential buildings' is not included in the tables but is shown as a footnote to Table 1.

10. *Commenced.* A building job is regarded as commenced when the first physical building activity has been performed on site in the form of materials fixed in place and/or labour expended. This includes site preparation but excludes delivery of building materials, the drawing of plans and specifications and the construction of non-building infrastructures such as roads.

11. *Under construction.* A building job is regarded as being under construction at the end of a period if it has been commenced but has not been completed and work on it has not been abandoned.

12. *Completed.* A building job is regarded as completed when building activity has progressed to the stage where the building can fulfil its intended function. In practice,

EXPLANATORY NOTES — *continued*

building jobs are treated as completed when notified as such by respondents to the survey.

13. *Valuation of building jobs.* The values in this publication are derived from estimates reported on survey returns.

14. *Value of building commenced, or under construction.* The estimated value represents the anticipated completion value based, where practicable, on estimated market or contract price of building jobs, excluding the value of land and landscaping. Site preparation costs are included. Where building jobs proceed over several quarters, the anticipated completion value reported on the return for the first (commencement) quarter may be amended on returns for subsequent (under construction) quarters as the job nears completion.

15. *Value of building completed.* The actual completion value based, where practicable, on the market or contract price of building jobs, including site preparation costs, but excluding the value of land and landscaping.

16. *Value of building work done during the period.* The estimated value of building work actually carried out during the quarter on building jobs which have commenced.

17. *Value of building work yet to be done.* The difference between the anticipated completion value and the estimated value of work done on building jobs up to the end of the period.

Building classification

18. The *ownership* of a building is classified as either 'public sector' or 'private sector' according to the sector of the intended owner of the completed building as evident at the time of approval. Residential buildings being consructed by private sector builders under government housing authority schemes whereby the authority has contracted, or intends to contract, to purchase the buildings on or before completion, are classified as public sector.

19. *Builder type.* Houses are classified according to the type of builder as follows:

(a) *Contractor-built houses.* Those constructed by a private recognised building contractor, either under contract, or in anticipation of sale or rental.

(b) *Houses built by other than contract builders.* Those constructed by an owner (other than a recognised building contractor) or under his direction, without the services of a single contractor responsible for the whole job. Houses built by businesses (other than recognised building contractors) and public sector organisations are also included in this category.

20. *Functional classification of buildings.* A building is classified according to its intended major function. A building which is ancillary to other buildings or forms a part of a group of related buildings is classified to the function of the building and not to the function of the group as a whole. An example of this can be seen in the treatment of building work approved for a factory complex. In this case a detached administration building would be classified to 'offices' and a detached cafeteria building to 'shops', while factory buildings would be classified to 'factories'. An exception to this rule is the treatment of group accommodation buildings where, for example, a student accommodation building on a university campus would be classified to 'educational'.

21. Examples of the types of buildings included under each main functional heading are shown in the following paragraphs.

22. *Houses.* Includes cottages, bungalows, detached caretakers'/managers' cottages and rectories.

23. *Other residential buildings.* Includes flats, home units, attached town houses, villa units, terrace houses, semi-detached houses and maisonettes.

24. *Hotels etc.* Includes motels, hostels, boarding houses, guest houses and holiday apartment buildings.

25. *Shops.* Includes retail shops, restaurants, cafes, taverns, dry cleaners, laundromats, hair salons and shopping arcades.

26. *Factories.* Includes paper mills, oil refinery buildings, brickworks, foundries, power houses, manufacturing laboratories and workshops as part of a manufacturing process.

27. *Offices.* Includes banks, post offices, council chambers and head and regional offices.

28. *Other business premises.* Includes warehouses, storage depots, service stations, transport depots and terminals, electricity substation buildings, pumping station buildings, telephone exchanges, mail sorting centres, broadcasting stations and film studios.

29. *Educational.* Includes schools, colleges, univer-sities, kindergartens, libraries, museums, art galleries, research and teaching laboratories and theological colleges.

30. *Religious.* Includes churches, chapels and temples.

31. *Health.* Includes hospitals, nursing homes, surgeries, clinics and medical centres.

32. *Entertainment and recreational.* Includes clubs, theatres, cinemas, public halls, gymnasiums, grandstands, squash courts and sports and recreation centres.

33. *Miscellaneous.* Includes law courts, homes for the aged (where medical care is not provided as a normal service), orphanages, prisons, barracks, mine buildings, glasshouses, livestock sheds, shearing sheds, fruit and skin drying sheds, public toilets and ambulance, fire and police stations.

Reliability of the estimates

34. Since the figures for private sector house building activity (including alterations and additions) are derived from information obtained from a sample of approved building jobs, they are subject to sampling error; i.e. they may differ from the figures that would have been obtained

EXPLANATORY NOTES — *continued*

if information for all approved jobs for the relevant period had been included in the survey.

35. A measure of the likely difference is given by the relative standard error of each estimate. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all approved jobs had been included, and about 19 chances in 20 that the difference will be less than two standard errors. Relative standard errors of the estimates are shown in Table 10.

36. An example of the use of standard errors is as follows. From Table 2 it can be seen that the estimate of the number of new private sector houses commenced during June quarter 1991 is 6,400. The associated relative standard error is 2.1 per cent (see Table 10). Therefore, there are about two chances in three that the value which would have been obtained if information had been obtained about all approved private sector house jobs would have been within the range 6,266 to 6,534 and about 19 chances in 20 that the value would have been within the range 6,131 to 6,669.

37. The imprecision due to sampling variability, which is measured by the relative standard error, should not be confused with inaccuracies that may occur because of inadequacies in the source of building activity information, imperfections in reporting by respondents and errors made in the coding and processing of data. Inaccuracies of this kind are referred to as non-sampling error and may occur in any enumeration whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by the careful design of questionnaires, efforts to obtain responses for all selected building jobs and efficient operating procedures.

Seasonal adjustment

38. Seasonally adjusted building statistics are shown in Tables 4, 5 and 7. In the seasonally adjusted series, account has been taken of normal seasonal factors and the effect of movement in the date of Easter which may, in successive years, affect figures for different quarters.

39. Since seasonally adjusted statistics reflect both irregular and trend movements, an upward or downward movement in a seasonally adjusted series does not necessarily indicate a change of trend. Particular care should therefore be taken in interpreting individual quarter to quarter movements. Each of the component series shown has been seasonally adjusted independently. As a consequence, while the unadjusted components in the original series shown add to the totals, the adjusted components may not add to the adjusted totals. Further, the difference between independently seasonally adjusted series does not necessarily produce series which are optimal or even adequate adjustments of the similarly derived original series. Thus the figures which can be derived by subtracting seasonally adjusted private sector dwelling units from the seasonally adjusted total should not be used to represent seasonally adjusted public sector dwelling units.

Estimates at constant prices

40. Estimates of the value of commencements at average 1984-85 prices are presented in original terms and for work done at average 1984-85 prices in original and seasonally adjusted terms.

41. Constant price estimates measure changes in value after the direct effects of price changes have been eliminated. The deflators used to revalue the current price estimates in this publication are derived from the same price data underlying the deflators compiled for the dwelling and non-dwelling construction components of the national accounts aggregate 'Gross fixed capital expenditure'.

42. Estimates at constant prices are subject to a number of approximations and assumptions. Further information on the nature and concepts of constant price estimates is contained in Chapter 4 of the ABS publication *Australian National Accounts: Concepts, Sources and Methods* (Catalogue No. 5216.0).
